QUEEN ELIZABETH THE SECOND

AND

DWIGHT DAVID EISENHOWER

PRESIDENT OF THE UNITED STATES OF AMERICA

# EDITOR'S PREFACE

BECAUSE utility was believed by the original editors, in 1768, and by subsequent editors, to be the "principal intention of every publication," the Britannica's progressive history has been one of expansion and enlargement, and the aim of the editors has been to sift the vast store of available knowledge and render its essential part accessible to all who read.

One difficulty has been to keep this essential part to a convenient and usable form. Times change, fresh information demands inclusion, and supplementary volumes added to old ones offer no adequate solution of the problem of keeping the reader abreast of the times; nor, indeed, do new editions solve the problem. Editions in the past have taken from three to fourteen years to make, and material in one volume was old before the next volume was made.

The matured three-point plan of continuous revision of the Britannica obviates these editorial difficulties.

By 1771, the Encyclopædia Britannica consisted of three moderately sized volumes. Today the Britannica is made up of three great units: the regular printing of the twenty-four volumes themselves; the annually issued Book of the Year; and the Library Research Service. Experience down the years indicates that 75% of the material in an encyclopædia needs changing only at long intervals. The other 25% requires continuous revision. With the plan of regular printings, all the material in the Britannica, both the 75% and the 25%, is scheduled in subject classifications for more extensive revisions than have ever before been possible in the history of encyclopædias. The result is that, within, of course, the obvious limitations set by the manufacture and structure of an encyclopædia of 38,000,000 words, the Britannica is never old. The second unit of the plan is the annual Book of the Year which keeps the information of the Britannica owner current. It is an encyclopædia of about 700,000 words covering the significant data of each succeeding year. The third unit is the Library Research Service, matured after years of useful activity, which each year answers thousands of questions of the moment for individuals who own the Britannica.

The three units which now constitute the Encyclopædia Britannica present a modern informational instrument in a changing and complex world. It is not the work of a few authors or of the authors of any one country. It is the result of the cordial co-operation of more than 4,700 authorities from all the countries of the world. Without their help no good work of reference, covering information on every essential subject, could be made.

The reader can contribute much toward the economical use of the great quantity of material in this reference set by first turning to the index in Volume 24 when in search of information. The index is the direct guide to the many thousands of topics in the 43,500 entries, and the way to use it is described on pages v–ix in Volume 24.

WILLIAM FIELDING OGBURN, *Sociology*
THOMAS PARK, *Zoology.*
JAMES B PARSONS, GEORGE W WHELAND } *Chemistry.*
HERMAN G RICHEY, *Education*
BIRGIT VENNESLAND, *Biochemistry.*
ALLEN P WIKGREN, *Religion.*

## ADDITIONAL CONSULTANTS AND ADVISERS

### UNITED STATES

W. C. ALLEE, *Head Professor of Biology, University of Florida, Gainesville, Florida.*
CHRISTOPHER E. BARTHEL, Jr., *Illinois Institute of Technology, Chicago, Illinois.*
D. A. BROWN, *Agriculture Librarian, Associate Professor of Library Science, University of Illinois, Urbana, Illinois.*
HORACE R. BYERS, *Chairman, Department of Meteorology, The University of Chicago, Chicago, Illinois.*
HARVEY WILEY CORBETT, *Associate Architect of Rockefeller Center, New York City.*
COLONEL CALVIN GODDARD, *United States Army (retired), Military Editor, Encyclopædia Britannica.*
JOHN B. HEFFERNAN, *Rear Admiral, U.S. Navy (retired), Director of Naval History, Navy Department.*
GEORGE HOWERTON, *Professor of Music History and Literature, Dean of the School of Music, Northwestern University, Evanston, Illinois.*
WARREN E HOWLAND, *Professor of Sanitary Engineering, Purdue University, Lafayette, Indiana.*
G. DONALD HUDSON, *Professor of Geography, University of Washington, Seattle, Washington.*
HANS HUTH, *Research Curator, Art Institute of Chicago, Chicago, Illinois.*
FORREST A. KINGSBURY, *Associate Professor Emeritus of Psychology, The University of Chicago, Chicago, Illinois.*
HANS KOHN, *Professor of History, City College, New York City.*
W. RHOADS MURPHEY, *Assistant Professor of Geography, University of Washington, Seattle, Washington.*
JOHN COURTNEY MURRAY, S.J., *Professor of Theology, Woodstock College, Woodstock, Maryland.*
JOHN L. PRATT, *President, A. S. Barnes & Company, publishers, New York, New York.*
C. HERMAN PRITCHETT, *Chairman of the Department of Political Science, The University of Chicago, Chicago, Illinois*
DEEMS TAYLOR, *American Composer, Author and Critic.*
LEONARD D. WHITE, *Professor of Public Administration, The University of Chicago, Chicago, Illinois.*

### GREAT BRITAIN

LORD ABERDARE, *Member of British Olympic Association; Chairman, National Association of Boys' Clubs.*
F. S. BOAS, *Vice-President, Royal Society of Literature; Former President of the English Association.*
AIR MARSHAL DOUGLAS COLYER, *Former Civil Air Attaché, Paris, Brussels, The Hague and Rome; Former Assistant Chief of Air Staff.*
H. C. DENT, *Educational Correspondent of* The Times, *London.*
H. J. FLEURE, *Former Professor of Geography, University of Manchester.*
E. HINDLE, *Former Scientific Director of the Zoological Society of London*
F. L KENT, *Librarian, U.N.E.S.C.O.*
W. C. KNEALE, *Lecturer in Philosophy and Fellow of Exeter College, Oxford.*
SIR JOHN RUSSELL, *Former Director of Rothamsted Experimental Station and of the Imperial Bureau of Soil Science; President of the British Association, 1949.*
W. T. WELLS, *Barrister-at-Law; Member of Parliament.*

A full list, in alphabetical order by initials, of all the writers for the *Encyclopædia Britannica* is to be found following this page. An alphabetical list by name follows on p. xcv.

# INITIALS AND NAMES OF CONTRIBUTORS

(FOR COMPLETE LISTING OF CONTRIBUTORS' ARTICLES SEE PAGE XCV)

**A. A. A.—A. A. Adnan.** Former *Professeur Agrégé* in the University of Istanbul, Turkey.

**A. A. Aa.—Aarne Armas Anttila.** Professor in Finnish Literature at the University of Helsinki, Helsinki, Fin. Author of *Vihtori Peltonen-Johannes Linnankoski I-II; Elias Lonnrot I-II.*

**A. A. An.—Arthur A. Allen.** Professor of Ornithology, Cornell University, Ithaca, N.Y.

**A. A. At.—A. Adrian Albert.** Professor of Mathematics, The University of Chicago. Author of *Modern Higher Algebra;* etc.

**A. A. B.—Albert A. Bennett.** Professor of Mathematics at Brown University, Providence, R. I. Author of *Tables for Interior Ballistics.*

**A. A. Bd.—Arthur A. Blanchard.** Emeritus Professor of Inorganic Chemistry, Massachusetts Institute of Technology, Cambridge, Mass. Co-author of *The Electrolytic Dissociation Theory; Synthetic Inorganic Chemistry.*

**A. A. Bi.—A. A. Blowski.** Technical Adviser, California and Hawaiian Sugar Refining Corporation, Ltd., Crockett, Calif.

**A. A. B.-P.—Anton Alexander Benedetti-Pichler.** Associate Professor of Chemistry, Queens College, Flushing, N.Y. Author of *Introduction to the Microtechnique of Inorganic Analysis.*

**A. Ai.—Alfred Ainger.** English divine and man of letters. Author of *Charles Lamb; The Life and Works of Charles Lamb.*

**A. A. M.—A. A. Michelson.** Nobel Prize for Physics, 1907.

**A. A. Ma.—Arthur Anthony MacDonell.** Former Professor of Sanskrit in Oxford University. Author of *A Vedic Grammar; A History of Sanskrit Literature;* etc.

**A. A. T.—Alrutheus Ambush Taylor.** Professor of History and Dean of the College of Liberal Arts, Fisk University, Nashville, Tenn Author of *The Negro in the Reconstruction of Virginia; The Negro in Tennessee, 1865–1880.*

**A. A. Y.—A. A. Yugow.** Author of *Economic Trends in Soviet Russia; Russia's Economic Front for War and Peace*

**A. B.—Aubrey FitzGerald Bell.** Author of *Portuguese Literature;* etc.

**A. Ba.—Adolfo Bartoli.** Former Professor of Literature at Instituto di studi superiori at Florence. Author of *Storia della letteratura Italiana;* etc.

**A. Bar.—Alice Prentice Barrows.** Specialist in School Buildings, U.S. Office of Education, Washington, D.C., 1919–42.

**A. B. B.—Alvin Barton Barber.** Colonel. Manager, Transportation and Communication Department, U.S. Chamber of Commerce, 1923–48.

**A. B. Bg.—Anton B. Burg.** Professor of Chemistry, University of Southern California, Los Angeles, Calif.

**A. B. Bo.—A. Bruce Boswell.** Bowes Professor of Russian History, Language and Literature, University of Liverpool, Eng.

**A. B. Bu.—A. B. Butts.** Technical Civilian Educational Advisor, U.S. Army Ground Forces, 1946–

**A. B. C.—A. B. Culley.** The Eagle Star and British Dominions Insurance Company.

**A. B. Cx.—Alonzo Bettis Cox.** Professor of Cotton Marketing, University of Texas, Austin, Tex. Author of *Cotton Markets and Cotton Merchandising.*

**A. Be.—Augustin Bernard.** Professor of Geography and of Colonization of the Peoples of North Africa, at the Sorbonne, Paris Author of *L'Archipel de la Nouvelle Calédonie; Les Régions Naturelles de l'Algérie;* etc.

**A. Ber.—Arthur Berry.** University Lecturer in Mathematics, 1914–29; Fellow and Vice-Provost of King's College, Cambridge, 1924–29.

**A. B. F. Y.—Alexander Bell Filson Young.** Editor, *Saturday Review,* 1921–24.

**A. B. G.—Alfred Bradley Gough.** Sometime Casberd Scholar of St. John's College, Oxford

**A. B. Go.—Lady Gomme.** Author of *Dictionary of Traditional Games of Great Britain and Ireland;* etc.

**A. B. H.—Albert Bushnell Hart.** Author of *Essentials of American History;* etc.

**A. B. Hl.—Alfred Brazier Howell.** Associate Professor of Anatomy, The Johns Hopkins Medical School, Baltimore, Md., 1932–44. Author of *Speed in Animals;* etc.

**A. Bi.—Prince Antoine Bibesco.** Rumanian Minister in Washington, D.C., 1920–26.

**A. Bk.—Alan Bullock.** Censor of St. Catherine's Society, Oxford University. University Lecturer in Modern History and formerly Fellow of New College, Oxford Author of *Hitler: A Study in Tyranny.*

**A. B. K.—Adrian B. Klein.** Major. Former Director of Experimental Department for Army Camouflage. Author of *Colour-Music; The Art of Light;* etc.

**A. B. L.—Arno B. Luckhardt, M.D.** Chairman, Department of Physiology, The University of Chicago.

**A. B. M.—Arthur Bartlett Maurice.** Former Literary Editor, *New York Herald.*

**A. B. Ml.—A. B. Meinel.** Associate Director, Yerkes and McDonald Observatories, Williams Bay, Wis. Associate Professor of Astrophysics, The University of Chicago.

**A. Boy.—Aram Boyajian.** Development Engineer, General Electric Company, Pittsfield, Mass.

**A. Br.—Alexander Brady.** Professor of Political Economy, University of Toronto, Canada. Author of *William Huskisson and Liberal Reform;* etc.

**A. B. R.—Alfred Barton Rendle.** Keeper of the Department of Botany, British Museum (Natural History), London, 1906–30.

**A. Bri.—Asa Briggs.** Reader in Recent Social and Economic History, Oxford University. Fellow of Worcester College, Oxford. Author of *History of Birmingham;* co-author of *Patterns of Peacemaking.*

**A. Bt.—Arnold Brecht.** Professor of Political Science, Jurisprudence and Public Finance, Graduate Faculty, New School for Social Research, New York, N.Y. Lecturer, Civil Affairs Training Schools, Harvard and Yale Universities, 1943–44. Author of *Prelude to Silence—The End of the German Republic; Federalism and Regionalism in Germany—The Division of Prussia;* etc.

**A. Bur.—Agnes Burke.** Former Instructor, Teachers College, Columbia University.

**A. B. W.—A. B. Wood.** Royal Naval Scientific Service.

**A. B. Wm.—A. B. Wollam.** Former Treasurer, American Sugar Refining Company, New York, N.Y.

**A. Bx.—Albert Bettex.** Literary Editor, *Du,* Zürich, Switz.

**A. By.—Alice Bradley.** Principal, Miss Farmer's School of Cookery, Boston, Mass., 1915–44. Author of *The Alice Bradley Menu-Cook-Book;* etc.

**A. Ca.—Arthur Capper.** United States Senator from Kansas, 1919–49. Former publisher and proprietor, *Topeka Daily Capital* (Kansas).

**A. Car.—Alexis Carrel, M.D.** Former member of the Rockefeller Institute for Medical Research. Nobel Prize for Medicine, 1912.

**A. C. B.—Alan Coates Bouquet, D.D.** Vicar of All Saints, Cambridge, Eng.

**A. C. Bk.—Alfred Charles Beck, M.D.** Professor of Obstetrics and Gynaecology, Long Island College of Medicine. Brooklyn, N.Y. Author of *Obstetrical Practice.*

**A. C. Bn.—A. C. Beaton.** Member of the Sudan Political Service.

**A. C. C.—Albert Curtis Clark.** Former Corpus Christi Professor of Latin, Oxford University. Editor of *Cicero's Speeches.*

**A. C. Ce.—Alistair Cameron Crombie.** Lecturer in History and Philosophy of Science, University College, London. Author of *Augustine to Galileo; The History of Science A.D. 400–1650; Robert Grosseteste and the Origins of Experimental Science.*

**A. C. Ck.—A. C. Cook.** Associate Animal Husbandman, U.S. Bureau of Animal Industry.

**A. C. Cs.—Alexander Crane Charters, Jr.** Aeronautical Research Scientist, Ames Aeronautical Laboratory of the National Advisory Committee for Aeronautics.

**A. C. D.—Arthur C. Dillman.** Associate Agronomist, in charge of Seed Flax Investigations, Division of Cereal Crops and Diseases, Bureau of Plant Industry, Soils and Agricultural Engineering, U.S. Department of Agriculture.

**A. C. de C.—Andrew Claude de la Cherois Crommelin.** President of the Royal Astronomical Society, 1929–30 Author of *The Star World; Catalogue of Comets;* etc.

**A. Ce.—Alexander Cowie.** Benjamin L. Waite Professor of English, Wesleyan University, Middletown, Conn. Author of *John Trumbull: Connecticut Wit; The Rise of the American Novel.*

**A. C. Es.—Arthur Cecil Edwards.** Author of *Persian Caravan.*

**A. C. G.—Alfred C. Gilbert.** Author of *Boy's Scientific Library.*

**A. Ch.—André Chaumeix.** Director of *La Revue des Deux Mondes,* Paris Editor of *Le Journal des Débats,* 1900–40 Director of *La Revue de Paris,* 1920–26.

**A. C. H.—Alfred Cort Haddon.** Reader in Ethnology in Cambridge University, 1909–26. Author of *The Wanderings of Peoples;* etc.

**A. C. He.—Rt. Rev. Arthur Cayley Headlam, D.D.** Former Bishop of Gloucester, Eng. Regius Professor of Divinity, Oxford University, and Canon of Christ Church, Oxford, 1918–23 Author of *The New Prayer Book;* etc.

**A. C. Hol.—Arthur C. Holden.** Holden, McLaughlin and Associates, Architects, New York, N Y Author of *The Primer of Housing; Pocket Guide to Good Construction;* etc.

**A. C. Hy.—Arthur C. Hardy.** Professor of Optics and Photography, Massachusetts Institute of Technology, Cambridge, Mass Author of *Handbook of Colorimetry; The Principles of Optics.*

**A. C. K.—Arthur Charles Keller.** Director of Switching Apparatus Development, Bell Telephone Laboratories, New York, N Y.

**A. C. Ke.—Arlington Colton Krause, M.D.** Professor of Surgery, Division of Ophthalmology, The University of Chicago. Author of *Biochemistry of the Eye.*

**A. C. McG.—Arthur Cushman McGiffert, D.D.** Professor of Church History, 1893–1927, and President of the Union Theological Seminary, New York, N Y., 1917–26.

**A. C. Or.—August Caesar Orthmann.** Consulting Chemist, President, Director, Orthmann Laboratories, Inc., Milwaukee, Wis.

**A. C. P.—Anna C. Paues.** Former Lecturer in Germanic Philology at Newnham College, Cambridge Author of *A Fourteenth Century Biblical Version;* etc.

**Ac. R.—Alec Robertson.** Author, critic, broadcaster. Specialist Talks Producer (Music), British Broadcasting Corporation, 1944–53 Author of *Dvořák; Sacred Music.*

**A. C. R.—Albert C. Ritchie.** Former Governor of Maryland. Professor of Law, University of Maryland, Baltimore, 1907–20.

**A. C. Re.—A. C. Reiley.** Author of *The Story of the Typewriter.*

**A. C. S.—Algernon Charles Swinburne.** English poet. Author of *Poems and Ballads; Age of Shakespeare;* etc.

**A. C. T.—A. C. Thaysen.** Former Principal Scientific Officer, Chemical Research Laboratory, Department of Scientific and Industrial Research, Teddington, Eng.

**A. C. V.—A. C. Vivian.** Assistant Secretary of Mines, Northern Rhodesia.

**A. Cy.—Sir Arthur Ernest Cowley.** Librarian, Bodleian Library, Oxford, 1919–31. Author of *Catalogue of the Hebrew Manuscripts in the Bodleian Library;* etc.

**A. D.—Alfred Dunhill.** Former Chairman and Founder of Alfred Dunhill, Ltd. Author of *The Pipe Book.*

**A. Da.—Allison Danzig.** Football Editor, *The New York Times*

**A. D. An.—Arthur D. Anderson.** Former Editor, *Boot and Shoe Recorder,* Boston, Mass Author of *Shoe and Leather Lexicon.*

**Ad. C. K.—Arnold Charles Kettle.** Lecturer in English Literature, University of Leeds, Leeds, Eng.

**Ad. E.—Arnold Edmunds.** Deputy Controller of Death Duties, Somerset House, Inland Revenue, London

**A. de B.—A. de Bouard.** Professor of Palaeography at the École Nationale des Chartes Author of *Manuel de Paléographie Latine et Française* (in collaboration with Maurice Prou); etc.

**A. D. G.—Andrew Dewar Gibb.** Professor of Law, University of Glasgow, Glasgow, Scot. Author of *Law of Collisions on Land: Scottish Judicial Dictionary.*

**A. D. H.—Sir Alfred Daniel Hall.** Former Director of the John Innes Horticultural Institution.

**A. D. I.—A. D. Imms.** Honourable Fellow of Downing College and Reader in Entomology, Cambridge University, 1931–45. Author of *A General Textbook of Entomology;* etc.

**A. D. J.—Adrian D. Joyce.** President and Chairman, The Glidden Company, Cleveland, Ohio.

**A. D. L.—Alexander Dunlop Lindsay, 1st Baron Lindsay of Birker.** Principal, North Staffordshire University College, Keele, Eng., 1949–52. Master of Balliol College, Oxford, 1924–49 Author of *Christianity and Economics; The Modern Democratic State;* etc.

**Ad. M.—Adolf Meyer.** Former Professor of Psychiatry, The Johns Hopkins University, and Director of Henry Phipps Psychiatric Clinic, The Johns Hopkins Hospital.

**A. D. M.—A. D. Mitchell.** Assistant Editor of the *Journal of the Chemical Society;* Assistant Examiner in Chemistry, University of London and Institute of Chemistry

**A. D. McD.—Angus D. McDonald.** President of the Southern Pacific Company, 1932–41.

**A. D. Mi.—Aristotle Demetrius Michal.** Professor of Mathematics, California Institute of Technology, Pasadena, Calif. Author of *Matrix and Tensor Calculus with Applications to Mechanics, Elasticity and Aeronautics.*

**A. D. Mo.—Arnaldo Dante Momigliano.** Professor of Ancient History in the University of London at University College, London. Author of *Claudius; Filippo il Macedone.*

**A. Do.—Austin Dobson.** English poet and man of letters Author of *Eighteenth-Century Vignettes; Hogarth; Fanny Burney;* etc.

**A. Dor.—Albert Dorfman, M.D.** Assistant Professor of Pediatrics, The University of Chicago.

**A. D. R.—Andrew Donald Roy.** University Assistant Lecturer in Statistics, Faculty of Economics and Politics, Cambridge University.

**A. D. R-C.—Alan Daubeny Russell-Clarke.** Barrister-at-Law Author of *Copyright in Industrial Designs; Copyright and Industrial Designs.*

**A. D. T.—Anne Dewees Taylor** (Mrs. Henry C. Taylor). Co-author of *World Trade in Agricultural Economics.*

**A. Du.—Alan L. Durst.** Teacher of Wood Carving at Royal College of Art, London.

**A. D. Z.—Augustus Delafield Zanzig.** Lecturer on Music Education, Harvard University. Director of Music, Brookline Public Schools, Brookline, Mass. Author of *Music in American Life; Singing America.*

**A. E.—Adrian Eckberg.** Master Gilder, Foreman. Vose Art Galleries, Boston, Mass.

**A. E. A.—Albert Ernest Alexander, M.D.** Professor of Applied Chemistry, New South Wales Institute of Technology, Sydney, Austr Co-author of *Colloid Science.*

**A. E. B.—Arthur E. Brown.** Author of *Brick Drying; Hand Brick Making.* Patentee of improvements in kilns and drying plants.

**A. E. Be.—Agnes E. Benedict.** Former Research Editor, National Association of Day Nurseries, Inc, New York, N Y.

**A. E. Bo.—Arthur Edwin Boycott, M.D.** Graham Professor of Pathology, University of London, 1915–35.

**A. E. C.—Arthur Edward Clery.** Barrister-at-Law. Former Professor of the Law of Property and of Contracts, University College, Dublin.

**A. E. Cn.—Aksel E. Christensen.** Professor in History in the University of Copenhagen, Copenhagen, Den. Author of *Dutch Trade to the Baltic about 1600; Kongemagt og Aristokrati.*

**A. E. D.—Albert Ernest Dunstan.** Chief Chemist of the Anglo-Iranian Oil Company, and Director, National Oil Refineries, Ltd.

**A. E. E.—Alfred E. Emerson.** Professor of Zoology, The University of Chicago Co-author of *Principles of Animal Ecology.*

**A. E. F.—Albert Edgar Feavearyear.** Former Undersecretary, Ministry of Food, London. Author of *The Pound Sterling.*

**A. E. G.—A. E. Garvie, D.D.** Former Principal of Hackney and New College, Hampstead, Eng. Editor of *Westminster New Testament* Author of *The Christian Doctrine of the Godhead.*

**A. E. H.—Adrian Elliot Hodgkin.** Major. The Technical Dept., Imperial Chemical Industries, Ltd.

**A. E. Ho.—A. E. Houghton.** Author of *Restoration of the Bourbons in Spain*

**A. E. Hu.—Sir Albert Edward Humphries.** Member of the Royal Commission on Wheat Supplies and Flour Mills Control, 1917–21.

**A. E. Hul.—A. Eaglefield Hull.** Former Editor, *Monthly Musical Record* Author of *Modern Harmony; Handbook of Bach's Works;* etc.

**A. Ei.—Albert Einstein.** Nobel Prize for Physics, 1921. Author of *Relativity, the Special and the General Theory;* etc.

**A. E. J.—Arthur Ernest Jolliffe.** Former Professor of Mathematics at King's College, London.

**A. E. J. R.—Rt. Rev. A. E. J. Rawlinson, D.D.** Bishop of Derby, Eng. Author of "The Gospel According to St. Mark," in the *Westminster Commentaries.*

**A. E. K.—Avery E. Kolb.** Chief, Staff Section, Highway Transport Service Division, Office of the Chief of Transportation, Department of the Army, Washington, D.C.

**A. E. L.—Ada E. Levett.** Reader in Economic History, King's College, London. Author of *English Economic History;* etc.

**A. E. M.—Arthur E. Morgan.** President, Antioch College, Yellow Springs, O., 1920–36. Author of *Education—Tools of the Arts of Life; The Human Goal of Education; A Compendium of Antioch Notes.*

**A. E. O.—Sir Arnold Edersheim Overton.** Permanent Secretary, Board of Trade, London, 1941–45.

**A. E. P.—Arthur E. Popham.** Keeper, Department of Prints and Drawings, British Museum, London. Author of *The Drawings of the Early Flemish School;* etc.

**A. E. R.—Albert Edward Richardson.** Emeritus Professor of Architecture, University of London. Author of *London Houses; Monumental Architecture;* etc.

**A. Es.—Arundell Esdaile.** President of the Library Association, 1939–45. Editor of *The Library Association Record,* 1924–35. Lecturer in Bibliography, London University School of Librarianship, 1919–39. Author of *The Sources of English Literature; The British Museum Library; A Student's Manual of Bibliography; Famous Libraries;* etc.

**A. E. Sh.—Austin E. Smith, M.D.** Editor, *Journal of the American Medical Association,* 1939– . Author of *Drugs You Use;* editor of *Medical Research: A Symposium;* co-editor of *Drug Research and Development.*

**A. E. Sm.—Alfred E. Smith.** Governor of New York, 1919–20, 1923–28.

**A. E. St.—Adlai E. Stevenson.** Governor of Illinois, 1949–53.

**A. E. Sta.—Alfred E. Stacey, Jr.** Consultant, Carrier Corporation, Syracuse, N.Y.

**A. E. T.—Alonzo Englebert Taylor, M.D.** Director of the Food Research Institute, Stanford University, Stanford, Calif., 1921–36. Author of *Digestion and Metabolism;* etc.

**A. E. Ta.—Alfred Edward Taylor.** Former Professor of Moral Philosophy in the University of Edinburgh, Scot. Author of *Plato, the Man and His Work; A Commentary on Plato's Timaeus;* etc.

**A. E. Tw.—A. E. Twentyman.** Former Librarian and Information Officer, Board of Education, London.

**A. E. Wd.—Arthur Evans Wood.** Emeritus Professor of Sociology, University of Michigan, Ann Arbor, Mich. Author of *Community Problems; Crime and Its Treatment.*

**A. F.—Sir Arthur Fell.** Former Honorary President, House of Commons Channel Tunnel Committee, London.

**A. Fa.—Rev. Alfred Fawkes.** Vicar of Ashby St. Ledgers, Eng.

**A. Far.—Alexander Farquharson.** General Secretary, Institute of Sociology, Ledbury, Eng.

**A. F. B.—Aldred Farrer Barker.** Professor of Textile Industries, Chiao-Tung University, Shanghai. Author of *Wool and the Textile Industries;* etc.

**A. F. Be.—Archibald Frank Becke.** Major, Royal Field Artillery (retired). Author of *Introduction to the History of Tactics.*

**A. F. Bn.—Arthur F. Buddington.** Professor and Chairman of the Department of Geology, Princeton University, Princeton, N J Author of *Geology and Mineral Deposits of Southeastern Alaska;* co-author of *Adirondack Igneous Rocks and Their Metamorphism.*

**A. F. Br.—A. F. Brinckerhoff.** Practising landscape architect, New York, N.Y.

**A. F. Ds.—Alan Fraser Davies.** Senior Lecturer in Political Science, University of Melbourne, Melbourne, Austr. Author of *Local Government in Victoria.*

**A. F. H.—A. F. Henderson.** Manager, The Theatres Mutual Insurance Company, Ltd., London.

**A. F. Hu.—A. F. Hutchison.** Sometime Rector of the High School, Stirling, Eng.

**A. F. K.—Albert Frank Kendrick.** Keeper in the Victoria and Albert Museum, London, in charge of Textiles, 1897–1924; of Ceramics, 1899–1902; and Woodwork, 1904–08. Author of *English Embroidery; Oriental Carpets;* etc.

**A. Fl.—Sir Alexander Fleming.** Professor of Bacteriology, St. Mary's Hospital Medical School, University of London, 1928–48 Nobel Prize for Medicine (with Sir Howard Florey), 1945

**A. F. M.—Allan F. Matthews.** Geologist, Operations Research Office, The Johns Hopkins University Baltimore, Md Materials Consultant Munitions' Security Resources Board, 1952 Assistant Director, Domestic Resource Area, President's Materials Policy Commission, 1951. Editor, *Minerals Yearbook,* 1947–50.

**A. Fo.—Alexander Forbes, M.D.** Professor of Physiology, Harvard University Medical School.

**A. Foe.—Anna Foehringer.** Senior Physicist of the Central Geophysical Observatory, Leningrad.

**A. For.—Alexander Forward.** Managing Director, American Gas Association.

**A. F. P.—Alfred Francis Pribram.** Former Professor of Modern History in the University of Vienna.

**A. F. Po.—Albert Frederick Pollard.** Founder and Chairman of the Institute of Historical Research, University of London, 1920–39.

**A. Fr.—A. Fisher.** Expert Examiner to the Board of Education, London. Gold Medallist, Barcelona. Author of *The Art of Enamelling on Metals;* etc.

**A. F. R.—Austin Flint Rogers.** Emeritus Professor of Mineralogy, Stanford University, Calif. Author of *Introduction to the Study of Minerals;* co-author of *Optical Mineralogy.*

**A. Fs.—Adalbert Farkas.** Research Chemist, Barrett Division, Allied Chemical and Dye Corp., Philadelphia, Pa. Author of *Orthohydrogen, Parahydrogen and Heavy Hydrogen;* etc.

**A. F. S.—Alexander Faulkner Shand.** Author of *The Foundations of Character;* etc.

**A. F. Sl.—A. Franklin Shull.** Professor of Zoology, University of Michigan, Ann Arbor, Mich. Author of *Heredity; Evolution.* Co-author (with G. R. LaRue and A. G. Ruthven), *Principles of Animal Biology.*

**A. F. Ws.—Alan Frank Wells.** Lecturer in Social Studies, University of Malaya, Singapore. Author of *The Local Social Survey in Great Britain;* etc.

**A. Fx.—Aileen Fox.** Lecturer in Archaeology, University College, Cardiff, Wales.

**A. F. Z. A.—Abul Faiz Ziauddin Ahmad.** Member of the Pakistan Foreign Service. Second Secretary to the High Commissioner for Pakistan in the United Kingdom.

**A. G. B. F.—Allan G. B. Fisher.** Price Professor of International Economics, Royal Institute of International Affairs, London, 1938–46. Author of *Economic Progress and Social Security;* etc.

**A. G. Bs.—Arthur Gilbert Bills.** Head of the Department of Psychology, University of Cincinnati, Cincinnati, O. Author of *General Experimental Psychology; The Psychology of Efficiency.*

**A. G. D.—Sir Arthur G. Doughty.** Former Archivist of the Public Records and War Trophies Canada. Author of *Quebec Under* [illegible] etc.

**A. G. D. W.—Arthur Gilbert Dixon West.** Chief Research Engineer, British Broadcasting Corporation.

**A. Gé.—André Géraud.** Pertinax (nom de plume). Foreign editor of *L'Echo de Paris,* 1917–18. Editor of *L'Europe Nouvelle,* 1939–40

**A. Gei.—Sir Archibald Geikie.** Director General of the Geological Survey of the United Kingdom and Director of the Museum of Practical Geology, London, 1881–1901

**A. G. F.—A. G. Francis.** Chemist, Government Laboratory, Clifford's Inn Passage, London.

**C. C. J. W.—Clement Charles Julian Webb.** Oriel Professor of the Philosophy of Christian Religion, Oxford University, 1920–30 Honorary Fellow of Oriel College and of Magdalen College, Oxford. Author of *In Time of War; Divine Personality and Human Life; History of Philosophy;* etc.

**C. Cl.—Charly Clerc.** Professor of French Language and Literature, Zürich Federal Polytechnic School Author of *Jésus et Marc Aurèle;* etc

**C. C. L.—Charles Christopher Lloyd, F.R.H.S.** Senior Lecturer, Royal Naval College. Greenwich, Eng. Author of *Captain Cook; Lord Cochrane; The Nation and the Navy;* etc.

**C. C. Le.—Clarence Cook Little.** Director, Roscoe B Jackson Memorial Laboratory, Bar Harbor, Me., 1929– . Managing Director, American Society for Control of Cancer, 1929–45. Author of *Civilization against Cancer.*

**C. C. M.—C. C. MacDuffee.** President, Mathematical Association of America, 1945–46 Author of *The Theory of Matrices;* etc.

**C. Com.—Christine Comber.** Foreign Research and Press Service, Royal Institute of International Affairs, London, 1941–43. Foreign Office, London, 1943–48.

**C. C. Pe.—Charles C. Price.** Professor of Chemistry, University of Notre Dame, Notre Dame, Ind Author of *Brief Course in Organic Chemistry; Reactions at the Carbon-Carbon Double Bond.*

**C. C. T.—Charles Cutler Torrey, D.D.** Emeritus Professor of Semitic Languages, Yale University. Author of *Our Translated Gospels;* etc.

**C. C. Ta.—Charles Callan Tansill.** Professor of American History, Georgetown U., Washington, D C Author of *Canada and Maryland Boundary Controversy;* etc.

**C. C. Tay.—Charles Carlisle Taylor.** Former British Vice-Consul at New York, N.Y. Author of *The Life of Admiral Mahan;* etc.

**C. Cy.—Charles Clay.** Director, Canadian Research and Editorial Institute. Author of *Muskrat Man; Phantom Fur Thieves; Young Voyageur;* etc

**C. C. Z.—Carle Clark Zimmerman.** Sociologist, Harvard University Author of *Family and Civilization; Graphic Regional Sociology.*

**C. Da.—Cyril James H. Davenport.** Major Former Superintendent of Bookbinding, British Museum, London. Author of *Cameos; Mezzotints;* etc.

**C. D. A.—Charles Dennis Adams.** Lecturer in Botany, University College of the Gold Coast, Achimota, Gold Coast.

**C. De.—Calvin Derrick.** Former Superintendent, State Home for Boys, Jamesburg, N J.

**C. D. Hd.—Charles DeWitt Hurd.** Professor of Chemistry, Northwestern University, Evanston, Ill. Author of *Open-Chain Nitrogen Compounds; Pyrolysis of Carbon Compounds.*

**C. D. J. B.—Coenraad Dirk Jan Brandt.** Extraordinary Professor in Contemporary History, University of Utrecht, Utrecht Neth.

**C. D. Mc.—Charles Duncan McGilvray, M.D.V., D.V.Sc.** Former Principal, Ontario Veterinary College, University of Toronto, Toronto, Ont. Author of *Bang's Disease in Cattle; Diseases of the Foal.*

**C. D. My.—Charles Dudley Massey.** Managing Director, Pickering and Chatto, London.

**C. Do.—Campbell Dodgson.** Keeper of Prints and Drawings, British Museum, London, 1912–32. Author of *Old French Colour-Prints; Woodcuts of the Fifteenth Century in the British Museum;* etc.

**C. D. R.—Charles Derek Ross.** Lecturer in Mediaeval History, University of Bristol, Bristol, Eng.

**C. D. S.—Chauncey Depew Snow.** Manager, American Section, International Chamber of Commerce, 1935–42.

**C. D. Sn.—C. D. Stein, V.M.D.** Veterinarian, Pathological Division, Bureau of Animal Industry, Agricultural Research Administration, U.S. Department of Agriculture, Washington, D.C.

**C. D. T.—Carl Dean Thompson.** Former Director, Public Ownership League of America. Author of *Municipal Ownership; Public Ownership;* etc.

**C. E.—Charles Everitt.** Sometime Scholar of Magdalen College, Oxford.

**C. E. A.—C. E. Allred.** Head of Department of Agricultural Economics and Rural Sociology, University of Tennessee, Knoxville.

**C. E. Br.—Charles E. Brown.** Lieut. Col. General Staff Corps, Office of the Chief of Staff, Department of the Army, Washington, D.C.

**C. E. Bs.—Charles E(verett) Bills.** Research Director, Mead Johnson and Company, Evansville, Ind.

**C. E. Bu.—Claude E. Buxton.** Professor of Psychology, Yale University, New Haven, Conn., 1949– .

**C. E. C.—Sir Charles Edward Callwell.** Major General Director of Military Operations at the War Office, London, 1914–16. Author of *Small Wars; The Dardanelles;* etc.

**C. E. C. F.—C. E. C. Fischer.** Assistant Botanist on Indian Botany, Kew Herbarium, Kew, England

**C. E. Cg.—Cecil Edwin Corrigan, M.D.** Assistant Professor of Surgery, University of Manitoba, Winnipeg, Man. Director, Departments of Surgery, Deer Lodge Hospital and St. Boniface Hospital, Winnipeg, Man. Author of *Clinical Diagnosis of Swellings.*

**C. E. Ch.—Charles Edward Chapman.** Professor of History, University of California, 1914–41. Author of *History of Spain;* etc.

**C. E. Cl.—Charles Edward Clark.** Judge, U.S. Court of Appeals, 2nd Circuit, 1939– . Dean of the Law School, Yale University, 1929–39. Author of *Code Pleading;* etc.

**C. E. Cn.—Charles Edward Cauthen.** Professor of History and Political Science, Wofford College, Spartanburg, S.C.

**C. E. De.—Charles Eugene Denney.** President, Northern Pacific Railway Co.

**C. E. F.—C. Ernest Fayle.** Author of *Seaborne Trade (History of the Great War); The War and the Shipping Industry;* etc.

**C. E. G.—C. E. Golding.** Treaty Insurances, Ltd., London.

**C. E. Gn.—C. E. Gapen.** Senior Information Specialist, Division of Information, Bureau of Plant Industry, Soils, and Agricultural Engineering, Agricultural Research Administration, U S Department of Agriculture, Beltsville, Md.

**C. E. H.—Charles Evans Hughes.** Chief Justice, Supreme Court of the United States, 1930–41. Secretary of State, 1921–25. Author of *Our Relation to the Nations of the Western Hemisphere;* etc.

**C. E. K.—Charles E. Kellogg.** Chief, Division of Soil Survey, Bureau of Plant Industry, Agricultural Research Administration, U S. Department of Agriculture, Beltsville, Md. Author of *Soils That Support Us; Soil Survey Manual.*

**C. E. Ke.—C. Edith Kerby.** Associate for Program Planning and Research, National Society for the Prevention of Blindness.

**C. E. K. M.—Charles Edward Kenneth Mees.** Director, Vice-President in Charge of Research, Eastman Kodak Company, Rochester, N.Y. Author of *The Fundamentals of Photography;* etc.

**C. El.—Sir Charles Norton Edgcumbe Eliot.** British Ambassador to Japan, 1919–26. Author of *Hinduism and Buddhism;* etc.

**C. E. L. C.—Charles E. L. Corthorn.** Assistant Manager and Secretary of the Ottoman Bank, 1911–28.

**C. E. Lu.—Cyril Edward Lucas.** Head of Department and Deputy Director of Research, Department of Oceanography, University College, Hull, Eng. Co-editor, *Hull Bulletins of Marine Ecology.*

**C. E. M.—Sir Charles Edward Mallet.** Secretary for Indian Students at the India Office, London, 1912–16. Author of *Herbert Gladstone, A Memoir;* etc.

**C. E. Mc.—Constantine Edward McGuire.** Economic adviser to private concerns and to governments. Author of *Germany's Capacity to Pay; Italy's International Economic Position.*

**C. E. Me.—Coyle E. Moore.** Dean of the School of Social Welfare, Florida State University, Tallahassee, Fla.

**C. E. N.—Charles Eliot Norton.** Editor of the *Orations and Addresses of George William Curtis;* etc.

**C. E. O'H.—Charles E. O'Hara.** Captain, U.S. Air Force. Instructor, Office of Special Investigations Training School, U S Air Force Co-author of *An Introduction to Criminalistics; Practical Photographic Chemistry.*

**C. E. P. B.—C. E. P. Brooks.** Former Honorary Secretary, Royal Meteorological Society.

**C. E. Pr.—Carl E. Pray.** Former Head, Department of History and Social Sciences, Michigan State Normal College, Ypsilanti, Mich.

**Ce. R.—Cecil Rowntree.** Former Consulting Surgeon to the Royal Cancer Hospital.

**C. E. R. S.—Charles Ely Rose Sherrington.** Secretary, British Railways Research Service.

**C. E. S.—Courtney Edward Stevens.** Tutor in Ancient History, Magdalen College, Oxford.

**C. Et.—Carl Eckart.** Associate Professor of Physics, The University of Chicago (on leave for government service).

**C. E. T.—Cecil Edgar Tilley.** Professor of Mineralogy and Petrology, Cambridge University, 1931–

**C. E. Ta.—Creassey Edward Cecil Tattersall.** Keeper, Department of Textiles, Victoria and Albert Museum, London (retired). Co-author of *Hand-Woven Carpets, Oriental and European;* etc.

**C. E. We.—Charles Edwin Weaver.** Professor of Palaeontology, University of Washington, Seattle, Wash.

**C. E. Wi.—Charles Edward Wilson.** Director, U.S. Office of Defense Mobilization, 1950–52. President, General Electric Company, 1940–50.

**C. F.—Cesare Foligno.** Professor of English, University of Naples, Italy, 1940– .

**C. F. A.—Charles Francis Atkinson.** Author, *The Wilderness and Cold Harbour.*

**C. F. A.-C.—Sir Charles Frederick Arden-Close.** Colonel. President, International Geographical Union, 1934–38. Author, *Text Book of Topographical Surveying;* etc.

**C. F. B.—Charles Francis Bastable.** Former Professor of Political Economy, Dublin University. Regius Professor of Laws, 1908–32. Author of *Theory of International Trade; Public Finance;* etc.

**C. F.-Br.—Sir Charles Fortescue-Brickdale.** Chief Registrar, Land Registry, 1900–23. Author of *Registration of Title to Land;* etc.

**C. F. C.—Charles Frederick Cross.** Analytical and consulting chemist. Co-author of *Researches on Cellulose; Text-Book of Paper-making.*

**C. Ff.—Charles John Ffoulkes.** Trustee of the Imperial War Museum, London, 1934–47. Author of *Armour and Weapons;* etc.

**C. F. F.—Carl F. Floe.** Professor of Metallurgy, Massachusetts Institute of Technology, Cambridge, Mass. Consulting metallurgist

**C. F. G.—Charles Francis Goldthwait.** Senior Cotton Technologist, Southern Regional Research Laboratory, U.S. Department of Agriculture, New Orleans, La., 1941– .

**C. F. Gu.—C. F. Gummer.** Professor of Mathematics at Queen's University, Kingston, Ont., Canada

**C. F. K.—Charles Fabens Kelley.** Curator of Oriental Art and Assistant Director of the Art Institute of Chicago

**C. F. Ke.—Charles Franklin Kettering.** Vice-President and Director, Charles F. Kettering Foundation, Inc.

**C. Fl.—Carl Flink.** Mechanical Engineer, American Radiator and Standard Sanitary Corporation, New York, N Y.

**C. F. L.-H.—Carl F. Lehmann-Haupt.** Former Professor of Ancient History in the University of Innsbruck, Austria

**C. F. Lo.—C. Frances Loomis.** Former Director of Program, Camp Fire Girls, Inc

**C. F. Ls.—Charles F. Lewis.** Director, the Buhl Foundation, Pittsburgh, Pa.

**C. F. McK.—Charles F. McKhann, M.D.** National Medical Director, United Cerebral Palsy Associations, Inc.

**C. F. R.—Sir Charles Fernand Rey.** Lieutenant Colonel Commander of the Star of Ethiopia, 1924 Author of *Unconquered Abyssinia as It Is Today;* etc.

**C. F. St.—Carl Frederic Schmidt, M.D.** Professor of Pharmacology, University of Pennsylvania, Philadelphia, Pa. Co-author of *Ephedrine and Related Substances;* co-editor, J. J. Macleod, *Physiology in Modern Medicine.*

**C. Fu.—Clyde Furst.** Former Secretary, Carnegie Foundation for the Advancement of Teaching.

**C. G.—Charles Gide.** Former Professor at the Collège de France, Paris.

**C. Ga.—Clement Gatley.** Author of *The Law and Practice of Libel and Slander in a Civil Action;* etc.

**C. G. A.—Charles Greeley Abbot.** Research Associate, Smithsonian Institution, Washington, D.C Director of the Smithsonian Astrophysical Observatory, 1907–44. Author of *The Sun;* etc.

**C. G. C.—Sir Charles Gibson Connell.** Senior Partner, Connell and Connell, Writers to the Signet, Edinburgh, Scot. Author of *Agricultural Holdings (Scotland) Acts.*

**C. Gd.—Calvin Goddard.** Colonel, U.S. Army, retired.

**C. G. D.—Sir Charles Galton Darwin.** Director of National Physical Laboratory, Teddington, Eng Tait Professor of Natural Philosophy in Edinburgh University Scot., 1923–36. Author of *The New Conceptions of Matter;* etc

**C. G. F.—Colin Garfield Fink.** Professor of Chemical Engineering, Head of Division of Electrochemistry, Columbia University, 1922–50. Invented ductile tungsten filament and electrochemical restoration of ancient bronzes.

**C. G. F. S.—Colin George Frederick Simkin.** Professor of Economics, Auckland University College, Auckland, N Z. Author of *The Instability of a Dependent Economy.*

**C. G. Gr.**—**Constantine G. Grand.** Research Associate, Laboratory of Cellular Physiology, New York University.

**C. G. H.**—**Clay G. Huff.** Chief Parasitologist, National Research Institute, Bethesda, Md., 1947– . Co-author of *Parasitology;* author of *A Manual of Medical Parasitology.*

**C. Gi.**—**Cedric Gibbons.** Art Director, Metro-Goldwyn-Mayer Studios, Culver City, Calif., 1924– .

**C. G. P.**—**Carl G. Paulsen.** Chief Hydraulic Engineer, Geological Survey, U.S. Department of the Interior.

**C. Gr.**—**Charles Gross.** Professor of History at Harvard University, 1888–1909. Author of *The Gild Merchant.*

**C. G. Ro.**—**Sir Charles Grant Robertson.** Principal, Birmingham University, Birmingham, Eng., 1920–38 Author of *England under the Hanoverians;* etc.

**C. Gs.**—**Clifford Goes.** Member of U.S Olympic Committee.

**C. G. S.**—**Charles Gabriel Seligman, M.D.** Former Professor of Ethnology, University of London

**C. G. T.**—**C. Gordon Tether.** Money Market Editor, the *Financial Times,* London

**C. G. W.**—**Carter Godwin Woodson.** Former Editor of *Journal of Negro History*

**C. H.**—**Charles Hose.** Member of the Sarawak State Advisory Council at Westminster, London, 1919.

**C. H. A.**—**Charles Henry Ambler.** Emeritus Professor of History, West Virginia University, Morgantown, W.Va Author of *History of Transportation in the Ohio Valley; Francis H. Pierpont.*

**C. H. B.**—**Charles Herbert Best, M.D.** Director of Banting-Best Department of Medical Research, University of Toronto, Canada, 1941– . Co-discoverer of insulin, 1921.

**C. H. Be.**—**Charles H. Behre, Jr.** Professor of (Economic) Geology, Columbia University, New York, N Y Member of Behre, Dolbear, and Company, consulting geologists and mining engineers, New York, N.Y.

**C. H. Br.**—**Sir Charles Herbert Bressey.** Principal Technical Officer, British Ministry of Transport, 1928–35

**C. H. C.**—**Charles Herbert Colvin.** Director, Daniel Guggenheim School of Aeronautics, New York University, 1941–44.

**C. H. C. B.**—**Charles H. Collins Baker.** Research in Art History, Huntington Library, Calif Author of *British Painting;* etc.

**C. H. Cn.**—**C. H. Curran.** Curator, American Museum of Natural History, New York, N Y. Author of *Families and Genera of North American Diptera;* etc.

**C. H. Cr.**—**Charles Howard Crane.** Architect, designer of Music Box and Guild Theatres, New York, N.Y., etc.

**C. H. D.**—**Charles H. Dennis.** Former Editor of the *Chicago Daily News.*

**C. H. F.**—**Clarence Henry Faust.** Dean of Humanities and Sciences and Professor of English, Stanford University, Stanford, Calif. Co-author of *Jonathan Edwards.*

**C. H. H.**—**Carlton Joseph Huntley Hayes.** Seth Low Professor of History in Columbia University Author of *Historical Evolution of Modern Nationalism;* etc.

**C. H. Hr.**—**Chester Henry Houser.** Curator of the Embryological Collection, Department of Embryology, Carnegie Institution of Washington, Baltimore, Md.

**C. H. K.**—**Clarence Hill Kelsey.** Former Chairman of the Board of Title Guarantee and Trust Company

**C. H. K. B.**—**The Rev. Canon Charles Henry Knowler Boughton.** Former Vicar of Saint John the Baptist, Knighton.

**C. H. Ky.**—**Clarence Hamilton Kennedy.** Professor of Zoology and Entomology Ohio State University, Columbus, Ohio Author of *Manual for the Study of the Internal Anatomy of Insects.*

**C. H. L.**—**Cecil H. Lander.** Professor of Engineering at Imperial College, London, 1931–46.

**C. H. LaW.**—**Charles H. LaWall.** Former Dean, Philadelphia College of Pharmacy and Science, Philadelphia, Pa

**C. H. L. J.**—**Charles Haven Ladd Johnston.** Author of *Famous Cavalry Leaders;* etc

**C. H. M.**—**Conrad Henry Moehlman.** Visiting Professor, School of Religion, University of Southern California, Los Angeles, Calif Author of *The Christian-Jewish Tragedy; Protestantism's Challenge; School and Church: The American Way; The Wall of Separation Between Church and State;* etc

**C. Ho.**—**Sir Charles Holroyd.** Director, National Gallery, London

**C. Hol.**—**Carl Hollweg.** Admiral. Former Director of Department in German Admiralty (Reichsmarineamt) Author of *Unser Recht auf dem U-Bootskrieg*

**C. Hos.**—**Constance Hoster.** Former Principal of Secretarial Training College for Educated Girls and Women, London. Author, with Ellen, Countess of Desart, of *Style and Title*

**C. H. P.**—**Charles Herman Pritchett.** Professor and Chairman of the Department of Political Science, The University of Chicago Author of *The Tennessee Valley Authority.*

**C. H. R.**—**Charles H. Reilly.** Former Professor of Architecture, University of Liverpool, England

**C. H. Rn.**—**Charles Howard Richardson.** Professor of Entomology, Iowa State College, Ames, Ia.

**C. H. T.**—**Crawford Howell Toy.** Former Professor of Hebrew and Oriental Languages, Harvard University.

**C. H. Tu.**—**Cuthbert Hamilton Turner.** Grinfield Lecturer on the Septuagint, 1925–27. Author of *Studies in Early Church History;* etc.

**C. H. Tut.**—**Charles H. Tuttle.** Member of the Board of Higher Education of the City of New York. Member of Special Committee of National Crime Commission, 1927– .

**C. H. van T.**—**Claude Halstead van Tyne.** Former Head of Department of History, University of Michigan, Ann Arbor, Mich. Author of *Causes of the War for Independence;* etc.

**C. H. V. S.**—**Charles Humphrey Vivian Sutherland.** Student of Christ Church, Oxford Author of *Coinage and Currency in Roman Britain; Coinage in Roman Imperial Policy; The Romans in Spain.*

**C. H. W.**—**Camilla H. Wedgwood.** Principal of Women's College, University of Sydney, Austr., 1935–44.

**C. J.**—**Charles James.** Former Professor of Chemistry, University of New Hampshire, Durham, N.H.

**C. J. B.**—**Charles Jasper Blunt.** Colonel, R A O C. Served in World War I at Gallipoli

**C. J. Bt.**—**Clarence Joseph Bulliet.** Former Art Critic, the *Chicago Daily News* Former Chicago Contributing Critic, *Art Digest,* New York, Author of *Apples and Madonnas; The Significant Moderns.*

**C. J. D.**—**Charles James Dunn.** Lecturer in Modern Japanese School of Oriental and African Studies, London

**C. J. F.**—**Charles James Fox.** Lieutenant Colonel Former Chief Officer, London Salvage Corps, and President of Association of Professional Fire Brigade Officers

**C. J. Ff.**—**Constance Jocelyn Ffoulkes.** Translator of Morelli's *Italian Painters;* etc.

**C. J. Fh.**—**Carl Joachim Friedrich.** Professor of Government and Director of the School for Overseas Administration, Harvard University, Cambridge, Mass Author of *The New Belief in the Common Man.*

**C. J. G.**—**Cyril John Gadd.** Deputy Keeper, Egyptian and Assyrian Antiquities, British Museum, London.

**C. J. H.**—**Sir Charles John Holmes.** Director of the National Gallery, London, 1916–28. Author of *Constable;* etc.

**C. J. Hk.**—**C. Judson Herrick.** Emeritus Professor of Neurology, The University of Chicago. Author of *Neurological Foundations of Animal Behavior;* etc.

**C. J. J.**—**Charles Jasper Joly.** Former Royal Astronomer of Ireland, and Andrews Professor of Astronomy in the University of Dublin, 1897–1906

**C. J. J. F.**—**Charles J. J. Fox.** Former Principal of Physical Chemistry, Royal Institute of Science, Bombay, India.

**C. J. L.**—**Sir Charles James Lyall.** Former Secretary, Judicial and Public Department, India Office, and Fellow of King's College, London Author of *Translations of Ancient Arabic Poetry;* etc.

**C. J. Ln.**—**C. J. Livingstone.** Industrial Fellow, Mellon Institute of Industrial Research.

**C. J. Mi.**—**Courtenay J. Mill.** City Editor of *The Times,* London.

**C. Joh.**—**Charles Johnston.** Bengal Civil Service (retired). Orientalist, author and student of bird life.

**C. J. P.**—**C. John Phillips.** Corning Glass Works, Corning, N.Y. Author of *Glass: The Miracle Maker.*

**C. J. Pf.**—**Carl J. Potthoff, M.D.** National Director of First Aid and Associate Medical Director, American Red Cross.

**C. J. Pn.**—**C. J. Pederson.** Research Associate, Jackson Laboratory, E. I du Pont de Nemours & Company, Wilmington, Del

**C. J. Sh.**—**Rev. Charles John Shebbeare, D.D.** Chaplain to H.M. the King, 1921–45. Author of *Religion in an Age of Doubt;* etc.

**C. K.**—**Charles Kerr, Jr.** Transportation Engineer, Westinghouse Electric and Manufacturing Company, East Pittsburgh, Pa.

**C. K. H.**—**Charles Kenneth Hobson.** Author of *The Export of Capital.*

**C. K. O.—Charles Kay Ogden.** Originator of Basic English. Organizer of the Orthological Institute, London. Founder, Basic English Foundation.

**C. Kr.—Clark Kerr.** Chancellor of the University of California, Berkeley, Calif. Co-author of *Unions, Management and the Public.*

**C. K. T.—Cheng Kwei Tseng.** Research Associate, Scripps Institution of Oceanography, University of California.

**C. K. W.—Charles Kingsley Webster.** Stevenson Professor of International History, London School of Economics, 1932– . Preparatory Commission to General Assembly, UN, London, 1945–46 Author of *British Diplomacy, 1813–1915;* etc

**C. K. We.—Chester Keeler Wentworth.** Principal Geologist, Honolulu Board of Water Supply, Honolulu, Haw.

**C. La.—Carney Landis.** Professor of Psychology, Columbia University Author of *Personality and Sex Problems; The Physically Handicapped Woman;* etc.

**C. L. A.—Charles L. Amick.** Illuminating Engineer, General Electric Company, Cleveland, O. Author of *Fluorescent Lighting Manual.*

**C. L. Bo.—Charles L. Bolte.** Major General. Director of Plans and Operations, General Staff, Department of the Army, Washington, D C.

**C. L. Bt.—Carroll L. Bryant.** National Director, Water Safety Service, American National Red Cross. Author of *Swimming and Diving; Life Saving and Water Safety.*

**C. Ld.—Catherine Littlefield.** Former Director, The Philadelphia Ballet Company, Philadelphia, Pa.

**C.-L. de B.—Charles-Louis de Beaumont.** Honorary Secretary, Amateur Fencing Association, London. Author of *Modern British Fencing; Fencing.*

**C. Le.—Cal Lewis.** Of The Manufacturing Clothier, New York, N.Y.

**Cl. F.—Clifford Frondel.** Associate Professor of Mineralogy and Curator of the Mineralogical Museum, Harvard University. Co-author of *System of Mineralogy of James Dwight Dana and Edward Salisbury Dana* (7th ed.).

**C. L. F.—C. L. Ferguson.** Former Assistant Clerk, House of Commons, London.

**C. L. Fe.—Carroll Lane Fenton.** Author of *Our Amazing Earth;* co-author of *The Rock Book; Story of the Great Geologists.*

**C. L. Gn.—Charles Lewis Gazin.** Curator of Vertebrate Palaeontology, U.S. National Museum, Smithsonian Institution, Washington, D.C.

**C. L. Hs.—Carl L. Hubbs.** Professor of Biology, Scripps Institution of Oceanography, University of California, La Jolla, Calif. Author of *Guide to the Fishes of the Great Lakes and Tributary Waters;* etc.

**C. Li.—Caldwell H. Lipsett.** Former Editor, *Civil and Military Gazette,* Lahore, India.

**C. L. K.—Charles Lethbridge Kingsford.** Assistant Secretary, Board of Education, London, 1905–12. Author of *Life of Henry V.*

**C. Ll. M.—Conwy Lloyd Morgan.** Former Professor of Zoology and Geology, University College, Bristol, England. Author of *Introduction to Comparative Psychology;* etc.

**C. L. P.—C. L. Patton.** Former President of the American Whist League.

**C. L. St.—C. L. Stewart.** Professor of Agricultural Economics and Chief in Land Economics, University of Illinois, Urbana.

**C. L. T.—Charles Lamar Thomas.** Associate Director of Research, Sun Oil Co., Marcus Hook, Pa.

**C. L. V. M.—Carroll L. V. Meeks.** Associate Professor of Architecture and the History of Art, Yale University.

**C. L. W.—Charles Leslie Wrenn.** Rawlinson and Bosworth Professor of Anglo-Saxon, Oxford University Fellow of Pembroke College, Oxford Author of *Beowulf,* an edition; *The English Language.*

**C. L. Wn.—Carl Louis Wilson.** Professor of Botany, Dartmouth College, Hanover, N.H.

**C. M.—Christopher Morley.** Author of *The Haunted Book Shop; Chimneysmoke; Inward Ho!; Thunder on the Left;* etc.

**C. Ma.—Charles Marriott.** Art Critic, *The Times,* London, 1924–40. Author of *Modern English Architecture;* etc.

**C. M. A.—C. M. Austin.** Commander, USN. Formerly stationed at Washington, D.C.

**C. Mas.—Charles Masson.** Conservateur Musée du Luxembourg.

**C. M. Ay.—Cecilia Mary Ady.** Honorary Fellow, St. Hugh's College, Oxford Author of *The Bentivoglio of Bologna; Milan Under the Sforza; Morals and Manners of the Quattrocento; Pope Pius II.*

**C. M. Br.—C. M. Breder, Jr.** Chairman and Curator, Department of Fishes and Aquatic Biology, the American Museum of Natural History, New York, N.Y. Author of *Field Book of Marine Fishes of the Atlantic Coast.*

**C. M. Cd.—Charles Manning Child.** Emeritus Professor of Zoology, The University of Chicago.

**C. M. Cl.—Constance Margaret Cornell.** Diplomatic Correspondent, *The Glasgow Herald.*

**C. M. Cr.—Charles M. Carpenter, M.D.** Professor and Chairman of the Department of Infectious Diseases, School of Medicine, University of California, Los Angeles, Calif.

**C. M. Cs.—Cecil Marvin Charles, M.D.** Associate Professor of Anatomy, Washington University, St. Louis, Mo.

**C. M. Cy.—Clifford M. Carey.** Director of Research, National Council of the Young Men's Christian Associations, New York, N.Y. Author of *Between Two Centuries.*

**C. M. D.—Carlton Miles Dean.** Assistant Manager, Engineering Sales, Monsanto Chemical Company, St. Louis, Mo.

**C. M. E. M.—Charles Marie Emmanuel Mangin.** General Commanding the French V, VI and X Armies, 1916–18, and the French forces in Rhineland, 1918–19.

**C. M. H.—Charles Meyer Hardin.** Assistant Professor of Political Science, The University of Chicago.

**C. M. H. C.—Charles Manning Hope Clark.** Professor of History, Canberra University College, Canberra, Austr. Editor of *Select Documents in Australian History, 1788–1850.*

**C. Mi.—Carl Theodor Mirbt.** Former Professor of Church History in the University of Marburg, Germany. Author of *Publizistik im Zeitalter Gregor VII; Quellen zur Geschichte des Papstthums;* etc.

**C. Mij.—Chedomille Mijatovich.** Former Senator of the Kingdom of Serbia Serbian Minister to the Court of St. James's, 1895–1900 and 1902–03. Author of *Serbia and the Serbians;* etc.

**C. M. J.—Rev. Charles Michael Jacobs, D.D.** Former Professor of Church History and President of the Graduate School, Lutheran Theological Seminary, Philadelphia, Pa. Editor of *Luther's Correspondence.*

**C. M. K.—Sir Charles Malcolm Kennedy.** Head of Commercial Department, Foreign Office, 1872–93.

**C. M. Kn.—C. M. Knowles.** Former Assistant Legal Adviser, Home Office, London.

**C. M. L.—Charles Mostyn Lloyd.** Lecturer and Head of the Department of Social Science and Administration in the London School of Economics and Political Science, University of London, Assistant Editor of *The New Statesman.*

**C. Mn.—Colin Matheson.** Keeper, Department of Zoology, National Museum of Wales, Cardiff, Wales Author of *Changes in the Fauna of Wales; Wales and the Sea Fisheries.*

**C. Mo.—Herbert Clifford Mortimer.** Barrister-at-Law, Probate and Divorce Court, London.

**C. Mon.—William Cosmo Monkhouse.** English poet and art critic. Author of *The Italian Pre-Raphaelites; Life of Turner;* etc.

**C. M. P.—Sir Charles Max Page.** Fellow of the Royal College of Surgeons, London. Author of *The Treatment of Fractures in General Practice;* etc.

**C. M. S.—Cecil M. Smith.** Editor, *Musical America.* Author of *Musical Comedy in America.*

**C. M. Tr.—Carlisle Monroe Thacker.** Solvay Process Corporation, Hopewell, Va.

**C. N. E.—Carl N. Everstine.** Research Assistant, Maryland Legislative Council.

**C. N. G.—C. Norman Guice.** Formerly on faculty of Stephens College, Columbia, Mo.

**C. N. H.—Clarence N. Hickman.** Research Physicist, Bell Telephone Laboratories, Inc., New York, N.Y.

**C. N. P.—Cyril Northcote Parkinson.** Raffles Professor of History, University of Malaya, Singapore. Author of *Trade in the Eastern Seas; War in the Eastern Seas (1793–1815).*

**Co. B.—Cornelius Betten.** Emeritus Professor of Entomology, Cornell University, Ithaca, N.Y. Author of *The Caddis Flies, or Trichoptera of New York State;* etc.

**C. O. B.—Charles Otto Blagden.** Dean, School of Oriental Studies, London, 1922–35.

**Co. C.—Colin Carmichael.** Editor, *Machine Design.*

**C. O. F.—Charles Owen Fairchild.** President, The Instrument Society of America. Co-author of *Pyrometric Practice.*

**C. O. G.—Charles O. Gregory.** Professor of Law, University of Virginia, Charlottesville, Va. Author of *Labor and the Law;* co-author of *Labor Law: Cases, Materials and Comments.*

**C. P.—Rev. Charles Plummer.** Former Fellow and Chaplain of Corpus Christi College, Oxford. Author of *Life and Times of Alfred the Great.*

C. Pa.—**Cesare Paoli.** Italian historian. Former Editor of *Archivio storico italiano*

C. P. B.—**Charles Paul Boner.** Associate Director, Underwater Sound Laboratory, Harvard University Author of *Laboratory Manual on General Physics;* etc

C. Pe.—**Charles Palache.** Emeritus Professor of Mineralogy, Harvard University. Co-author of *Dana's System of Mineralogy.*

C. Pf.—**Christian Pfister.** Former Professor at the Sorbonne, Paris Author of *Étude sur le règne de Robert le Pieux;* etc

C. P. I.—**Sir Courtenay Peregrine Ilbert.** Former Clerk of the House of Commons and Chairman of Statute Law Committee.

C. P. L.—**Rev. Charles Patrick Loughran, S.J.** Professor of Classics, St. Andrew on Hudson, Poughkeepsie, N.Y

C. P.-li.—**Chen Pu-lai.** Secretary to Chiang Kai-shek. Former Editor, *Shang Pao* and *China Times*

C. Pn.—**Charles Parmin.** Honorary Teacher of English, Lycée Marcel Gambier, Lisieux, Fr

C. P. N.—**Charles P. Nash, Jr.** Professor of Law, University of Virginia, Charlottesville, Va.

C. P. O.—**Charles P. Olivier.** Director of Flower Observatory and Cook Observatory, University of Pennsylvania, Philadelphia, Pa. Author of *Meteors;* etc.

C. P. S.—**Clifford P. Smith.** Former Editor, Department of History of The First Church of Christ Scientist, Boston, Massachusetts.

C. P. Sa.—**Charles Percy Sanger.** Formerly of Lincoln's Inn, Barrister-at-Law.

C. P. Sy.—**Charles Perry Stacey.** Colonel, Canadian Army. Director, Historical Section, Army Headquarters, Ottawa, Ont Author of *Canada and the British Army; The Canadian Army,*

C. P. W.—**Charles P. Wood.** Industrial Engineer, Lockwood Greene Engineers, Inc, New York, N.Y. Author of *Factors Controlling the Location of Various Types of Industry.*

C. P. Y.—**Constantin Prodomos Yaglou.** Associate Professor of Industrial Hygiene, Harvard University School of Public Health, 1938– .

C. R.—**Cecil Roth.** Reader in Post-Biblical Jewish Studies, Oxford University, 1939– . Author of *The Last Florentine Republic;* etc.

C. Ra.—**Cornelia M. Raymond.** Former Director, Bureau of Publications, Vassar College, Poughkeepsie, N.Y.

C. R. Al.—**Carl R. Addinall.** Foreign Scientific Adviser of Merck & Co., Inc., Rahway, N.J. Author of *Story of Amino Acids.*

C. R. B.—**Sir Charles Raymond Beazley.** Emeritus Professor of History, Birmingham University, England. Co-author of *History of Russia;* author of *Nineteenth Century Europe;* etc.

C. R. Bn.—**Charles Ridgaway Bragdon.** Consulting Chemical Engineer, Larchmont, N.Y.

C. R. Br.—**Rev. Charles Reynolds Brown, D.D.** Former Dean, the Divinity School, Yale University, New Haven, Conn. Author of *The Modern Man's Religion;* etc.

C. Re.—**Charles Reitell.** Partner, Stevenson, Jordan and Harrison, Inc., management engineers, New York, N.Y.

C. R. Fi.—**Carl Russell Fish.** Former Professor of American History, University of Wisconsin, Madison, Wis. Author of *American Diplomacy;* etc.

C. R. Gy.—**Carl Raymond Gray, Jr.** Administrator of Veterans' Affairs, Veterans Administration, Washington, D.C., 1947–53.

C. R. H.—**C. R. Houseman.** Of the British Oxygen Company Ltd, Research Laboratory, Middlesex, Eng

C. Ric.—**Corrado Ricci.** Former President of the Royal Institute of Archaeology and History of the Arts. Author of *Il Correggio;* etc

C. R. K.—**Charles Richard Knappett, M.D.** Lecturer, Department of Bacteriology St. Mary's Hospital Medical School, London

C. R. Me.—**Carl Richard Moore.** Professor of Zoology, The University of Chicago

C. Rn.—**Chaim Rabin.** Cowley Lecturer of Post-Biblical Hebrew, Oxford University Author of *Ancient West-Arabian; The Zadokite Documents.*

C. R. N.—**Carl Robert Noller.** Professor of Chemistry, Stanford University, Stanford. Calif.

C. R. P.—**Chesley R. Perry.** President, Rotary Club of Chicago, Ill, 1944–45.

Cr. R.—**Chester Rapkin.** Research Associate, Institute for Urban Land Use and Housing Studies, Columbia University, New York, N.Y. Author of *Housing Market Analysis;* co-author of *Urban Traffic.*

C. R. Ro.—**Clarence Rufus Rorem.** Executive Director, Hospital Council of Philadelphia, Philadelphia, Pa Author of *The Public's Investment in Hospitals; Private Group Clinics;* etc.

C. R. S.—**C. Richard Soderberg.** Dean of Engineering. Massachusetts Institute of Technology, Cambridge, Mass.

C. R. Wy.—**Charles R. Whittlesey.** Professor of Finance and Economics, University of Pennsylvania, Philadelphia, Pa Economist, the Penn Mutual Life Insurance Company. Author of *International Monetary Issues.*

Cs. B.—**Carlos Baker.** Chairman, Department of English, Princeton University, Princeton, N.J. Author of *Hemingway: the Writer as Artist; Shelley's Major Poetry.*

D. Gry.—**Dorothy Grafly.** Curator of collections, Drexel Institute, Philadelphia, Pa., 1934–45. Author of *Parade of American Art* series.

D. G. Z.—**Donald Guyer Zink.** Superintendent, Chemical Products Department, Stanolind Oil and Gas Company, Tulsa, Okla.

D. H.—**David Hannay.** Former British Vice-Consul at Barcelona. Author of *Short History of Royal Navy, 1217–1688;* etc.

D. H. A.—**Donald Hatch Andrews.** Professor of Chemistry and Director, Cyrogeny Laboratory, The Jonns Hopkins University, Baltimore, Md.

D. He.—**Dudley Heath.** Author of *Miniatures; Tradition and Modern Schools;* etc.

D. H. L.—**Dickson H. Leavens.** Former Research Associate, Cowles Commission for Research in Economics, The University of Chicago. Author of *Silver Money.*

D. H. Lr.—**Derrick Henry Lehmer.** Associate Professor of Mathematics, University of California, Berkeley, Calif.

Dh. M.—**Sir Dhiren Mitra.** Legal Adviser and Minister, India House, London.

D. H. M.—**Donald Howard Menzel.** Professor of Astrophysics, Harvard University. Author of *A Study of the Solar Chromosphere; Stars and Planets;* etc.

D. H. P.—**David Henry Peacock.** Former Professor of Chemistry, University of Rangoon, Rangoon, Burma. Author of *Life of Joseph Priestley.*

D. H. Pe.—**Douglas Henry Pike.** Reader in History, University of Adelaide, Adelaide, Austr.

D. Hr.—**Davenport Hooker.** Professor of Anatomy and Head of Anatomy Department, School of Medicine, University of Pittsburgh, Pittsburgh, Pa. Managing Editor, *Journal of Comparative Neurology.*

D. H. R.—**Dennis Holme Robertson.** Professor of Political Economy, Cambridge University, 1944– . Author of *Money* in Cambridge Economic Handbook series.

D. H. S. C.—**Very Rev. David Herbert Somerset Cranage.** Dean of Norwich, Eng., 1928–45.

D. Hu.—**Dard Hunter.** Author of *Primitive Papermaking; Old Papermaking;* etc.

D. I. C.—**Denis Irvine Coomber.** Senior Scientific Officer, Department of the Government Chemist, London

D. J.—**Diamond Jenness.** Former Chief, Division of Anthropology, National Museum of Canada, Ottawa, Ont. Author of *The Indians of Canada; The People of the Twilight;* etc.

D. Ja.—**Dunham Jackson.** Professor of Mathematics, University of Minnesota, Minneapolis, Minn., 1919–46. Author of *Fourier Series and Orthogonal Polynomials;* etc.

D. J. D.—**Delbert J. Duncan.** Professor of Marketing, University of California, Berkeley, Calif. Co-author of *Marketing: Principles and Methods; Retailing: Principles and Methods.*

D. J. H.—**Donald J. Hart.** Dean, College of Business Administration, University of Idaho, Moscow, Ida.

D. J. K.—**Duncan J. Kerr.** Former President, Lehigh Valley Railroad, New York, N.Y.

D. J. M.—**D. J. Matthews.** Formerly with Hydrographic Department, Admiralty, London. Former Hydrographer, Laboratory of the Marine Biological Association of the United Kingdom, Plymouth.

D. J. W.—**Dorothy Julia Willmann.** Associate Editor, *Now.* National Organizational Secretary, Women's Parish Sodalities of the United States. Author of *Parish Sodality Helps; Parish Union Helps.*

D. K.—**David Kinley.** Former President, University of Illinois, Urbana, Ill. Author of *The Independent Treasury of the United States;* etc.

D. Ka.—**Daniel Katz.** Professor and Chairman of the Department of Psychology, Brooklyn College, Brooklyn, N.Y.

D. Kg.—**Donald King.** Assistant Keeper, Victoria and Albert Museum, London.

D. Kn.—**Dorothy Kenyon.** Member, League of Nations Committee on Legal Status of Women, 1938–43.

D. K.-P.—**Douglas King-Page.** Author of *Marine Insurance in 1931.*

D. K. Pe.—**Don K. Price.** Associate Director of Public Administration Clearing House, Chicago, Ill. Co-author of *City Manager Government in the United States.*

D. L.—**David Lyell.** Colonel. Former Director of Pauling and Company, Ltd., London. Chief Railway Construction Engineer to the British Army in France during World War I.

D. L. F.—**Denis L. Fox.** Associate Professor of Marine Biochemistry, Scripps Institution of Oceanography, University of California, La Jolla, Calif

D. L. Hk.—**Dalziel Llewellyn Hammick.** Fellow and Tutor, Oriel College Oxford. Aldrichian Praelector in Chemistry, Oxford University Author of *Introduction to Organic Chemistry.*

D. L. Mu.—**David Leslie Murray.** Editor, *Times* Literary Supplement, London, 1938–44. Author of *Disraeli.*

D. L. R. L.—**David Lockhart Robertson Lorimer.** Lieutenant Colonel, Indian Army (retired). Former H.M. Consul, Kerman and Persian Baluchistan; Civil Governor, Amāra, 1915–16. Author of *Phonology of the Bakhtiari Badakhshani and Madaglashti Dialects of Modern Persian;* etc.

D. L. W.—**D. L. Walker.** General Secretary to the Federation of British Industries.

D. L. Wr.—**David L. Webster.** Professor of Physics, Stanford University, Stanford, Calif. Co-author of *General Physics for Colleges.*

D. L. Ws.—**Dick Lloyd Wilks.** Member of the staff, Research and Statistics Office, Reserve Bank of New Zealand, Wellington, N.Z.

D. M.—**Rev. Dugald Macfadyen.** Former Director of the London Missionary Society.

D. Ma.—**David Masson.** Former Historiographer Royal for Scotland. Professor of Rhetoric and English Literature, Edinburgh University, 1865–93. Author of *Life of Milton;* etc.

D. M. B.—**Dorothy M. Broome.** Former Jones Fellow in the Victoria University of Manchester, England.

D. M. Bl.—**Delbert M. Bergenstal, M.D.** Assistant Professor of Medicine, The University of Chicago Medical School, Chicago, Ill.

D. McM.—**David MacMillan.** Assistant General Manager of Braby's Iron and Steel Sheet Rolling Mills and Galvanizing Works, Glasgow, Scot.

D. Md.—**Duncan MacDougald, Jr.** Author of *The Languages and Press of Africa.*

D. Me.—**Sir David Milne.** Permanent Undersecretary of State for Scotland, Edinburgh, Scot.

D. M. H. E.—**D. M. H. Evans.** Member of the Sudan Political Service.

**Ed. W.—Edward Pearson Warner.** President of the Council, International Civil Aviation Organization, Montreal, Canada. Author of *The Aviation Handbook; Airplane Design.*

**Ed. Ws.—Edward Wichers.** Chief, Division of Chemistry, National Bureau of Standards, U.S. Department of Commerce, Washington D.C.

**E. E.—Earl Franklin English.** Dean of the Faculty, School of Journalism, and Professor of Journalism, University of Missouri, Columbia, Mo Author of *Devices in Journalism; Introduction to Journalism Research Methods;* co-author of *Scholastic Journalism*

**E. E. A.—Eugene E. Agger.** Professor and Head of the Department of Economics and Director of Bureau of Economic and Business Research, Rutgers University, New Brunswick, N J Author of *The Budget in the American Commonwealth;* etc.

**E. E. B.—Edward E. Bennett.** Professor of History and Political Science, Montana State University, Missoula, Mont.

**E. E. Bs.—Sir Edward Ettingdene Bridges.** Permanent Secretary to H.M. Treasury, London.

**E. E. C.—Elliott E. Cheatham.** Professor of Law, Columbia University, New York, N Y Editor, *Cases on the Legal Profession;* co-editor, *Cases on Conflict of Laws.*

**E. E. De.—E. E. Dale.** Research Professor of History, University of Oklahoma, Norman, Okla. Author of *The Range Cattle Industry; Cow Country;* etc.

**E. E. DeT.—Ernest E. DeTurk.** Professor of Soil Fertility, University of Illinois, Urbana, Ill.

**E. E. E.—E. E. Evans.** Lecturer in Geography, University of Belfast, N.Ire.

**E. E. Es.—Everett Eugene Edwards.** Agricultural Historian, Division of Statistical and Historical Research, Bureau of Agricultural Economics, U.S Department of Agriculture, Washington, D.C., 1927– . Editor of *Agricultural History,* 1931– .

**E. E. F.—Edward Elway Free.** Consulting chemist and physicist. Lecturer on Outlines of Science, New York University, 1926–34. Author of *Pocket Guide to Science.*

**E. E. H.—Edward Everett Hale.** American writer. Author of *The Man Without a Country.*

**E. E. He.—Edgar Erskine Hume, M.D.** Brigadier General, formerly with U.S. Army. Commanding Officer, Winter General Hospital, Topeka, Kan., 1942–43. Former Associate Editor, *Annals of Medical History.*

**E. E. K.—Edward Ernest Kellett.** Former literary critic and author. Former Senior English Master, the Leys School, Cambridge, Eng. Author of *Suggestions; Fashion in Literature; The Northern Saga;* etc.

**E. E. L.—Edward Ernest Long.** British journalist.

**E. En.—Edward Epstean.** Former Treasurer and Director, Walker Engraving Corporation, New York, N.Y.

**E. E. R.—Edgar Eugene Robinson.** Director, Institute of American History, and Executive Head, Department of History, Stanford University, Stanford, Calif. Author of *The Presidential Vote; The New United States; The Evolution of American Political Parties.*

**E. E. S.—Edward Ernest Sikes.** Former Fellow, President and Lecturer, St. John's College, Cambridge. Newton Student at Athens, 1890. Editor of Aeschylus' *Prometheus Vinctus,* 1898; *The Homeric Hymns,* 1904. Author of *Anthropology of the Greeks;* etc.

**E. E. Sh.—Eben E. Smith, M.D.** Captain, Medical Corps, U.S. Navy, 1941– . Editor, *U.S. Naval Medical Bulletin;* Instructor in History of Medicine, U S. Naval Medical School, Washington, D.C.

**E. E. Sl.—E. E. Slosson.** Author of *Great American Universities; Snapshots of Science.*

**E. E. Sm.—Ernest Ellsworth Smith, M.D.** Former specialist in Experimental Medicine and Chemical Warfare.

**E. E. T.—Ernest Edgar Thum.** Editor, *Metal Progress*; Author of *Practice Book in Elementary Metallurgy*; Editor and Compiler of *National Emergency Steels*; etc.

**E. E. Wa.—E. E. Ware.** The Sherwin-Williams Company, Cleveland, O.

**E. E. Wi.—Edwin Eliott Willoughby.** Chief Bibliographer, The Folger Shakespeare Library, Washington, D.C., 1935– . Author of *The Times and Books of William Jaggard*; etc.

**E. F. A.—Edward F. Albee.** Former President of the Keith-Albee Circuit, New York, N.Y.

**E. F. Be.—E. F. Bullene.** Major General, U.S. Army. Chief Chemical Officer, U.S. Department of the Army, Washington, D.C.

**E. F. B. G.—Elinor F. B. Grogan (Lady Grogan).** Author of articles on Balkan subjects in the *Nineteenth Century*; *New Europe*; etc.

**E. F. C.—Eugene Francis Clark.** Secretary, Dartmouth College, Hanover, N.H., 1918–30. Former Editor, *150 Years of Dartmouth College*; *Dartmouth Alumni Magazine*.

**E. F. D.—Edward French Dow.** Professor of Government and Head of the Department of History and Government, University of Maine, Orono, Me.

**E. F. G.—Edwin Francis Gay.** Professor of Economic History, Harvard University, 1924–36 Member of Research Staff, Huntington Library, San Marino, Calif., 1936–46.

**E. F. H.—Eldred Frederick Hitchcock.** Director Sisal Estates, Ltd., Bird and Company (Africa), Ltd. During World War I, Government Wool Statistician and Deputy Director, Wool Textiles, War Office, London.

**E. Fi.—Eugen Fischer.** Author of *Kriegsschuldfrage und Aussenpolitik* and *Holsteins grosses Nein*.

**E. F. J.—Ernest Fraser Jacob.** Chichele Professor of Modern History, Oxford University. Fellow of All Souls College, Oxford. Author of *Essays in the Conciliar Epoch*; *Medieval Humanism and the Renaissance*; *The Register of Archbishop Henry Chichele*.

**E. F. L.—Edward F. Law.** Messrs. Riley, Harbord and Law, consulting metallurgists and chemists.

**E. F. La.—Edward Frederick Lawson, 4th Baron Burnham.** Major General. Director of Public Relations in the War Office and Senior Military Advisor to Ministry of Information, 1942–45.

**E. F. M.-S.—Elizabeth F. Malcolm-Smith.** Former Fellow of Newnham College, Cambridge.

**E. F. O.—Edwin F. Orlemann.** Assistant Professor of Chemistry, University of California, Berkeley, Calif.

**E. F. Ph.—Everett Franklin Phillips.** Former Professor of Apiculture, Cornell University, Ithaca, N.Y. Author of *Beekeeping*.

**E. Fr.—Edward Fuller.** Compiler of *International Handbook of Child Care and Protection*. Editor, *The World's Children*, London.

**E. F. R.—Eleanor F. Rathbone.** Member of Parliament (Ind.) Combined English Universities, 1929–46.

**E. F. Rg.—Edward F. Rogenberg, M.D.** Assistant Professor of [illegible] Medical School, Chicago, Ill. Staff member, Michael Reese Hospital and Mt Sinai Hospital, Chicago. Co-[illegible] author, *Therapeutics in Internal Medicine*; *Arthritis and Allied Conditions*.

**E. F. S.—Edward Fairbrother Strange.** Lieutenant Colonel. Former Keeper of Woodwork, Victoria and Albert Museum, London. Author of *Chinese Lacquer*; *Flowers and Plants for Designers and Schools*; etc.

**E. F. S. D.—Lady Dilke.** Author of *French Painters of the Eighteenth Century*; etc.

**E. F. W.—Eltinge Fowler Warner.** Publisher, *Field and Stream*, New York, N.Y.

**E. F. Wn.—Edward Foss Wilson.** President, Wilson and Company, Inc, Chicago, Ill., 1934– .

**E. F. Wr.—Elizabeth Farrar Wecter.**

**E. G.—Sir Edmund Gosse.** Former Assistant Librarian, British Museum, London Author of *History of Eighteenth Century Literature*; etc.

**E. Gar.—E. Garcke.** Former Managing Director of British Electric Traction Co., Ltd. Author of *Manual of Electrical Undertaking*; etc.

**E. G. Bor.—Edwin Garrigues Boring.** Professor of Psychology, Harvard University. Author of *History of Experimental Psychology*; *The Physical Dimensions of Consciousness*; Co-editor of *Psychology: A Factual Textbook*; etc.

**E. G. Bow.—E. G. Bowen.** Professor of Geography and Anthropology, University College of Wales, Aberystwyth.

**E. G. Br.—Elmer Grimshaw Butler.** Vice-President, the American Society of Zoologists, 1946. Professor of Zoology, Princeton University, 1937– . Chairman of Department of Biology, 1933–

**E. G. C.—E. Gladys Clarke.** Former Principal of the National Training College of Domestic Subjects, London.

**E. G. Co.—Ernest George Coker.** Former Professor of Civil and Mechanical Engineering, and Dean of the Faculty, University of London.

**E. G. G.—E. G. Gardner.** Former Professor of Italian at University College, University of London. Author of *Dante*; *Dante and the Mystics*.

**E. G. Gr.—Eugene Gifford Grace.** Chairman and Director, Bethlehem Steel Corporation and Bethlehem Steel Company.

**E. G. H.—Earl Grant Harrison.** Dean of the Law School and former Vice-President, University of Pennsylvania, Philadelphia, Pa. Practising lawyer.

**E. Gi.—Eric Gill.** Sculptor and engraver. Author of *Work and Property*.

**E. G. K.—E. Gordon Keith.** Associate Professor of Finance, Wharton School of Finance and Commerce, University of Pennsylvania, Philadelphia, Pa.

**E. Gl.—Lord Edward Gleichen.** Major General. Former Equerry to H.M. the King. Served in the South African War and in World War I.

**E. G. M.—Edwin George Morgan.** Lecturer in English, University of Glasgow, Glasgow, Scot. Translator of *Beowulf*.

**E. G. Mc.—Elizabeth Glen McAllister.** Member of the Executive, Town and Country Planning Association, London. Co-author of *Town and Country Planning*; Joint Editor of *Homes, Towns and Countryside*.

**E. G. P.—Edward Greydon Pickels.** President, Specialized Instruments Corp, San Carlos, Calif

**E. Gr.—Ernest Arthur Gardner.** Vice Chancellor of the University of London, 1924–26 Former Yates Professor of Archaeology, University College, University of London. Author of *The Art of Greece*.

**E. G. R.—Ernest George Ravenstein.** Professor of Geography at Bedford College, University of London, 1882–83 Author of *The Russians on the Amur*; *A Systematic Atlas*; etc

**E. Gru.—Ernest Gruening, M.D.** Governor of Alaska, 1939– . Chairman, Alaskan War Council Former Editor of the *Nation*; *New York Evening Post*; etc

**E. G. Rw.—Eugene George Rochow.** Professor of Chemistry, Harvard University. Author of *Chemistry of the Silicones*; *General Chemistry: a Topical Approach*.

**E. G. W.—Ernest Glen Wever.** Professor of Psychology, Princeton University, Princeton, N.J.

**E. H.—Emil Hatschek.** Lecturer on Colloids at the Sir John Cass Technical Institute, London. Author of *Introduction to the History of Colloids*.

**E. H. A.—Edmund Hugh Ashton.** Director, Native Administration, Bulawayo, Southern Rhodesia. Author of *The Basuto*.

**E. H. B.—Sir Edward Herbert Bunbury.** Author of *A History of Ancient Geography*; etc.

**E. H. Bn.—E. H. Baumgarten.** Secretary, American Bowling Congress Author of *Bowl—Here's How*.

**E. H. C.—Ernest Hartley Coleridge.** Editor of *Byron's Poems*; *Letters of Samuel Taylor Coleridge*; etc.

**E. Hd.—Edwin Haward.** Secretary, India, Pakistan and Burma Association, London. Author of *A Picture of India*; etc.

**E. He.—Edouard Herriot.** President of the French Chamber of Deputies, 1925, 1936 and 1947– . Author of *Madame Récamier et ses amis*.

**E. Hea.—Edward Heawood.** Librarian, Royal Geographical Society, 1901–34. Author of *Geography of Africa*; etc.

**E. Her.—Ernst Emil Herzfeld.** Former Professor at Institute for Advanced Study, Princeton, N.J. Explorations and travels in Kurdistan, Constantinople, India, Syria, Turkey, Persia, Afghanistan.

**E. H. G.—Emile Henry Gauvreau.** Author of *What So Proudly We Hailed*; *My Last Million Readers*; *Billy Mitchell, Prophet Without Honor*; etc.

**E. H. H.—E. Herman Hespelt.** Professor of Spanish, New York University.

**E. H. He.—Ernest Herman Hahne.** Former President, Miami University, Oxford, O.

**E. Hi.—Eva Hibbert.** Assistant Lecturer in Applied Chemistry, University of Manchester, England.

**E. Hir.—Emanuel Hirsch.** Former Professor of Church History, University of Göttingen, Germany.

**E. H. Kd.—Earle Hesse Kennard.** Physicist, U.S. Navy Dept., Washington, D.C. Professor of Physics, Cornell University, Ithaca, N.Y., 1927–46. Author of *Kinetic Theory of Gases*; etc.

**E. H. L.—Eugene Heitler Lehman.** President, Highland Manor School and Junior College, West Long Beach, N.J Editor of *Camps and Camping*. Associate Editor of *Camp Life*.

**E. H. Ld.—Erwin Hugo Loewenfeld.** Solicitor of the Supreme Court, Great Britain Legal Adviser of Liechtenstein Government Co-author of *Recht der Staatsangehorigkeit; Der Zivilprocess in den Europaischen Staaten.*

**E. H. M.—Sir Ellis Hovell Minns.** Former President and Professor of Archaeology, Pembroke College, Cambridge Translator and Editor of *Bruckner's Literary History of Russia.* Author of *Scythians and Greeks;* etc

**E. H. Mh.—E. H. Macintosh.** Member of the Sudan Political Service

**E. H. My.—Earl Hamlet Myers.** Oceanographer, Scripps Institution of Oceanography, La Jolla, Calif Co-author of *Invertebrates: The Protozoa;* etc.

**E. Hn.—Edward Hutton.** Member of the Council of the British Institute of Florence, Italy Author of *Italy and the Italians; Giovanni Boccaccio;* etc.

**E. H. N.—Edgar Hugo Nollau.** Former Staff Assistant, Chemical Division, E I. du Pont de Nemours and Company, Wilmington, Del.

**E. Hol.—Emory Holloway.** Professor of English, Queens College, Brooklyn, N Y., 1939– . Author of *Whitman: An Interpretation in Narrative.* Editor of *Leaves of Grass;* etc.

**E. Hr.—Edna Heibreder.** Professor of Psychology, Wellesley College, Wellesley, Mass. Author of *Seven* [illegible] ; etc.

**E. Hs.—Enriqueta Harris.** Member of the staff, Warburg Institute, University of London. Author of *Spanish Painting: the Prado.*

**E. H. Sg.—Edward Helmer Stromberg.** Director of Publicity and Publications, Northwestern University, Evanston, Ill.

**E. H. St.—Ernest Haywood Swift.** Professor of Analytical Chemistry, California Institute of Technology, Pasadena, Calif. Author of *A System of Chemical Analysis;* co-author of *Qualitative Chemical Analysis.*

**E. Hu.—Edmund Husserl.** Former Professor of Philosophy, University of Freiburg, Germany.

**E. H. W.—Egbert H. Walker.** Assistant Curator, U.S. National Museum Washington, D.C Co-author of *A Bibliography of Eastern Asiatic Botany* (with E D. Merrill).

**E. I. J.—E. Ibbetson James.** Former member of the Secretariat, League of Nations, and International Labour Office, Geneva, Switz

**E. I. Je.—Eldon I. Jenne.** Supervisor of Health, Physical Education and Recreation, Portland Public Schools, Portland, Ore.

**E. J.—Ernest Jones, M.D.** President of the International Psycho-Analytical Association. Honorary President of the Institute of Psycho-Analysis and the British Psycho-Analytical Society. Founder and former Editor of the *International Library of Psycho-Analysis.*

**E. Ja.—Edgar Jadwin.** Major General. Former Chief of Engineers, U.S. Army, Washington, D.C.

**E. J. B.—Edward John Bicknell, D.D.** Professor of New Testament Exegesis, King's College, University of London, 1928–33. Author of *A Theological Introduction to the Thirty-nine Articles;* etc.

**E. J. Bn.—Edgar John Bergen.** Radio entertainer. Creator of comedy characters "Charlie McCarthy" and "Mortimer Snerd."

**E. J. D.—Emile Joseph Dillon.** Author of *Russian* [illegible] *Maxim Gorky; The Peace Conference*

**E. J. En.—Edward J. Engel.** Former President, Atchison, Topeka and Santa Fe Railway Company.

**E. J. F.—Sir Edgar John Forsdyke.** Director and Principal Librarian, British Museum, London, 1936– Editor of the *Journal of Hellenic Studies,* 1912–23

**E. J. K.—Ely Jacques Kahn.** Architect for U S government housing projects. Author of *Design in Art and Industry*

**E. J. McN.—Edward Joseph McNamara.** [illegible] High School of Commerce, New [illegible] Author of *Methods of Teaching Shorthand;* etc

**E. J. Mr.—Edward John Minser.** Assistant Manager of Operations, Trans-World Airline.

**E. Jn.—Edna Jackson.** Deputy Chief Nursing Officer, Ministry of Health, London

**E. J. N. W.—E. J. N. Wallis.** Governor of the Province of Khartoum, Anglo-Egyptian Sudan

**E. J. O.—Elder J. Olson.** Associate Professor of English, The University of Chicago. Author of *Thing of Sorrow; The Cock of Heaven; General Prosody.*

**E. J. P.—E. J. Passant.** University Lecturer in History and Fellow of Sidney Sussex College, Cambridge.

**E. J. Q.—E. J. Quirin.** President, F. R. Harris, Incorporated, New York, N.Y.

**E. J. R.—Sir (Edward) John Russell.** Director, Rothamsted Experimental Station, Harpenden, En[illegible] Author of *English Farming; The* [illegible] *the Soil; Soil Conditions and Plant Growth.* Editor of *Agriculture To-day and Tomorrow*

**E. J. S.—Sir Edward James Salisbury.** Director, Royal Botanic Gardens, Kew, Eng. Author of *The Living Garden; The Reproductive Capacity of Plants.*

**E. J. Sz.—Edward J. Stieglitz, M.D.** Consultant in Geriatrics, Veterans Administration, Washington, D.C. Consulting Editor of *Geriatrics* Author of *Abnormal Arterial Tension; Arterial Hypertension; A Future for Preventive Medicine; The Second Forty Years;* editor of *Geriatric Medicine*

**E. J. T.—Edward J. Thomas.** Translator, *Vedic Hymns.* Author of *The Life of Buddha as Legend and History.*

**E. J. W.—E. J. Walaszek.** Research Fellow, National Cancer Institute.

**E. J. Wg.—E. J. Working.** Professor of Agricultural Economics, University of Illinois, Urbana, Ill.

**E. J. Wn.—E. John Workman.** President, Director of Research and Development Division and Professor of Physics, New Mexico School of Mines, Socorro, N.M. Co-author of *A Preliminary Investigation of the Electrical Structure of* [illegible] etc.

**E. K.—Ernst Kühnel.** Keeper of Islamic Art in the Berlin Museum Author of *Miniaturmalerei im Islam; Maurische Kunst;* etc.

**E. Ka.—Edward Kasner.** Adrain Professor of Mathematics, Columbia University. Author of *New Names in Mathematics;* etc.

**E. K. C.—Sir Edmund Kerchever Chambers.** Author of *The Mediaeval Stage; The Elizabethan Stage; William Shakespeare;* etc.

**E. K. F.—Earl K. Fischer.** Former Head, Physical Chemistry Division, Institute of Textile Technology, Charlottesville, Va

**E. Kk.—Edward Kook.** Sales Manager-Treasurer, Century Lighting, Inc. Technical lighting consultant.

**E. Ku.—Eugene Kulischer.** Demographer, Library of Congress, Washington, D.C Author of *Europe on the Move; The Displacement of Population in Europe.*

**E. K. W.—E. K. Wade.** Author of *The Piper of Pay.*

**E. La.—Eduard Laaman.** Chief Editor of *Vaba Maa* (Estonian paper), 1923– . Director of the Press Bureau at the Estonian Ministry for Foreign Affairs, 1920–24

**El. B.—Elizabeth Bacon.** Ethnographic expeditions in Kazakstan, Iran and Afghanistan Former Instructor, Far Eastern Department, University of Washington, Seattle, Wash

**E. L. Bf.—Elias Lunn Bredsdorff.** University Lecturer in Danish, Cambridge University Author of *Danish Literature in English Translation; D H. Lawrence, An Introduction to Scandinavian Literature; John Steinbeck.*

**E. L. D.—Edward L. Drew.** Statistician, Tanners' Council of America, Inc, New York, N Y

**E. L. De.—Everette Lee DeGolyer.** Senior partner, DeGolyer and MacNaughton, Dallas, Tex Consulting geologist and petroleum engineer

**E. Le.—Emil Lederer.** Former Professor, Faculty of Philosophy, University of Heidelberg, Germany Former Editor of *Archiv für Sozialwissenschaft und Sozialpolitik;* etc.

**E. L. F.—Ernest Louis Franklin.** Former senior partner in the banking firm of Samuel Montagu and Company, London.

**E. L. H.—Eardley Lancelot Holland, M.D.** President of the Royal College of Obstetricians and Gynaecologists, 1943–46. Former Editor of *Journal of Obstetrics and Gynaecology of British Empire*

**El. Hn.—Ellsworth Huntington.** Former Research Associate in Geography Yale University Explorations and travels in Persia, India, China, Siberia, Asia Minor, Central America, etc. Author of *Civilization and Climate;* etc.

**E. L. Hs.—Ethel L. Hutchins.** Head, Reference Department, Cincinnati Public Library, Cincinnati, O

**El. K.—Ethel Kawin.** Director, Parent Education Project, and Research Associate, The University of Chicago Author of *Children of Preschool Age;* [illegible] *of Toys.*

**E. L. Ka.—Edward L. Kropa.** Research Chemist, American Cyanamid Company, Stamford, Conn.

**E. Ll.—Edgar Lobel.** Sublibrarian, Bodleian Library, Oxford. Reader in Papyrology, Oxford University.

**E. L. M.—Rev. Edward L. Murphy, S.J.** Professor of Ascetical Theology and Missiology, Weston College, Weston, Mass.

**E. L. Mn.—Edwin Lakenan Marvin.** Associate Professor of Philosophy and Psychology, Montana State University, Missoula, Mont.

**E. Lo.—Ellis Lovejoy.** Research Director, Edward Orton Ceramic Foundation, Columbus, O., 1933– . Author of *Scumming and Efflorescence; Drying and Burning Clay Wares; Scum on Clay Wares;* etc.

**E. Lok.—Eugene Lokey.** Vice-President, New York Stock Exchange, New York, N Y

**E. L. Po.—Edith Louise Potter, M.D.** Associate Professor of Pathology, Department of Obstetrics and Gynecology, [illegible] The University of Chicago, Chicago, Ill Author of *The Fundamentals of Human Reproduction;* etc

**E. L. Pr.—E. L. Peffer.** Chief, Capacity and Density Section, National Bureau of Standards, U S Department of Commerce, Washington, D C.

**E. L. Ru.—E. Leighton Rudolph.** Associate Professor of English [illegible] of Arkansas, Fayetteville, Ark. Author of *Confederate Broadside Verse.*

**E. Ls.—Edith Lutyens.** Designer and executor of costumes, New York, N Y.

**E. Lu—E. S. Lumsden.** Painter and etcher Author of *The Art of Etching;* etc.

**E. Lud.—Emil Ludwig.** Author of biographies of Bismarck, William II, etc.

**E. L. W.—Ernest Llewellyn Woodward.** Former Lecturer in Modern History and Tutor at New College, Oxford. Author of *War and Peace in Europe;* etc

**E. MacN.—John Eoin MacNeill.** Former Professor of Early History, University College, National University of Ireland, Dublin.

**E. Mar.—Sir Edward Howard Marsh.** Former Private Secretary to Winston Churchill. Author of *Memoir of Rupert Brooke;* etc.

**E. M. B.—E. M. Brannon.** Judge Advocate General of the U.S. Army, Washington, D.C

**E. M. Br.—Eliza Marian Butler.** Emeritus Professor, Cambridge University. Author of *The Fortunes of Faust; Rainer Maria Rilke; The Tyranny of Greece Over Germany.*

**E. McC.—Edward McCartan.** Former Member of National Sculptors' Society.

**E. M. C. D.—Edward M. C. Denny.** Barrister-at-Law of Gray's Inn and the Western Circuit, England.

**E. M. D.—Edwin Merrick Dodd.** Former Professor of Law, Harvard University.

**E. Mey.—Emile Meyerson.** Former Professor of Philosophy, Académie des Sciences Morales et Politiques, Institut de France, Paris.

**E. M. Ge.—Esson M. Gale.** Counsellor to Foreign Students and Director, International Center University of Michigan, Ann Arbor, Mich Editor, *Journal of the Royal Asiatic Society, North China Branch,* 1932–37.

**E. M. H.—Edward Mandell House.** Colonel. Representative of the United States at the making of the Armistice, Versailles, 1918 Co-editor, with Charles C. Seymour, of *What Really Happened at Paris.*

**E. M. H. L.—Edward Mayow Hastings Lloyd.** Undersecretary, Ministry of Food, Great Britain Author of *Experiments in State Control; Stabilisation.*

**E. M. Ho.—Edward Morell Holmes.** Former Curator of the Museum of the Pharmaceutical Society, London.

**E. M. Hw.—Elizabeth M. Halcrow.** Archivist, Town Clerk's Department, Newcastle upon Tyne, Eng.

**E. M. L. M.—Emile Marie Louis Madelin.** Chairman of The French Alliance of the United States and of Canada, 1907–08. Author of *La Bataille de France;* etc

**E. M. N.—Edward Max Nicholson.** Ornithologist Oxford University Greenland [illegible] 1928 Author of *Birds in England; How Birds Live;* etc

**Em. O.—Emil Ott.** Director of Research, Hercules Powder Company, Wilmington, Del

**E. Mor.—Elliott Morrill.** Vice-President in Charge of Research, Rit Products Corporation, Chicago, Ill.

**E. Mr.—Ernest Mezger** Conseil juridique, Paris Author of [illegible] *commercial et l'ordre public; Moyens de défense et voies de recours contre une sentence arbitrale étrangère.*

**E. M. S.—Elmer M. Soles, O.D.** Optometrist Director of Public Information, American Optometric Association.

**E. Mt.—Edward Myatt.** Financial Journalist Member of staff, *Investors' Chronicle.*

**E. M. T.—Sir Edward Maunde Thompson.** Director and Principal Librarian of the British Museum, 1888–1909 Author of *Shakespeare's Handwriting;* etc.

**E. M. W.—Edmund Murton Walker.** Professor, Invertebrate Zoology and Head of Department of Zoology, University of [illegible], Royal Society of Canada.

**E. M. Wa.—Rev. Edward Mewburn Walker.** Former Chaplain to the King; Provost of Queen's College, Oxford, 1930–33. Author of *Greek History, Its Problems and Its Meaning;* etc.

**E. N. da C. A.—Edward Neville da Costa Andrade.** Quain Professor of Physics, University of London. Author of *The Structure of the Atom;* etc.

**E. N. H.—Edmund Newton Harvey.** H. F. Osburn Professor of Physiology, Princeton University. Vice-President, Marine Biological Laboratory, Woods Hole, Mass. Author of *The Nature of Animal Light; Living Light;* etc.

**E. O. E.—E. O. Essig.** Professor of Entomology, University of California; Head of the Division of Entomology and Parasitology, California Agricultural Experiment Station. Author of *Insects of Western North America; College Entomology;* etc.

**Eo. S.—Emilio Segrè.** Professor of Physics, University of California, Berkeley, Calif.

**E. O. S.—Elbert Orla Sowerwine.** Vice-President, Anaconda Copper Mining Company, New York, N.Y.

**E. Ow.—Ernest Ower.** Author of *The Measurement of Air Flow.*

**E. P.—Edgar Prestage.** Former Professor of Portuguese Language, Literature and History, University of London. Former Editor of *Zurara's Chronicle of Guinea;* etc. Author of *D. Francisco Manuel de Mello* in Hispanic Society's Portuguese series; etc.

**E. Pa.—Eric Parker.** Editor of "The English Scene" Series; Editor in Chief of *The Field,* 1930–37. Author of *Elements of Shooting;* etc.

**E. P. B.—E. Phillips Barker.** Reader in Classics, University College, Nottingham, England.

**E. P. Bs.—E. Power Biggs.** Concert, radio and recording organist. Fellow of the Royal Academy of Music, London.

**E. P. C.—Edward Provan Cathcart.** M D. Regius Professor of Physiology, University of Glasgow, Scotland, 1928–47 Member of War Cabinet Scientific Committee on Food Policy.

**E. P. Cu.—Ellwood P. Cubberley.** Former Dean, School of Education, Stanford University, Stanford, Calif Author of *History of Education; Public School Administration;* etc.

**E. P. F.—Ephraim Porter Felt.** Director and Chief Entomologist Bartlett Tree Research Laboratories, Stamford, Conn, 1928–43. Author of *Plant Galls and Gall Makers,* etc.

**E. P. Ft.—Einar P. Flint.** Chairman of the Ceramics and Minerals [illegible] Research Foundation, [illegible] of Technology, Chicago, Ill.

**E. P. L.—Ernest Preston Lane.** Professor of Mathematics, The University of Chicago Author of *Projective Differential Geometry of Curves and Surfaces;* etc.

**E. P. N.—Edwin P. Norwood.** Author of *The Other Side of the Circus;* etc.

**E. Pu.—Monsignor Enrico Pucci.** Former Domestic Prelate to the Pope Former Editor, *Corriere d' Italia.* Author of *La Pace del Laterano.*

**E. R.—Elihu Root.** Former Member, Permanent Court of Arbitration at The Hague; Secretary of War in Cabinet of President McKinley, 1899–1902 Secretary of State in Cabinet of President Theodore Roosevelt, 1905–09. Awarded Nobel Peace Prize, 1912.

**E. R. Cn.—E. Richard Cohen.** Physicist, Atomic Energy Research Department North American Aviation, Inc., Downey, Calif.

**E. R. Cy.—Everett Ross Clinchy.** President, National Conference of Christians and Jews. Author of *All in the Name of God; Handbook on Human Relations; Human Relations Centers; World We Want To Live In.*

**E. R. E.—Edwin Rogers Embree.** Former President, Julius Rosenwald Fund. Author of *Brown America, The Story of a New Race; Color and Democracy;* etc.

**E. R. G. R. E.—Edward Ratcliffe Garth Russell Evans, 1st Baron Mountevans.** Admiral, Royal Navy. Author of *Keeping the Seas; South with Scott;* etc.

**Er. H.—Eric Hutton.** Writer and Editor, *Toronto Star,* Toronto, Can., 1929–46.

**E. Rh.—Ernest Rhys.** Former Editor of "Everyman's Library."

**E. R. J.—Emory Richard Johnson.** Professor of Transportation and Commerce, University of Pennsylvania, Philadelphia, Pa, 1902–50 Dean, Wharton School of Finance and Commerce, University of Pennsylvania, 1919–33. Author of *Inland Waterways, Their Relation to Transportation;* etc.

**E. Rl.—Elbert Russell.** Former Dean, School of Religion, Duke University, Durham, N.C. Author of *The Parables of Jesus; The History of Quakerism;* etc.

**E. R. L.—Edmund Ronald Leach.** Lecturer in Anthropology, Cambridge University Author of *Political Systems of Highland Burma; Social Economic Organization of the Rowanduz Kurds.*

**E. R. Ld.—E. R. Loveland.** Executive Secretary, American College of Physicians.

**E. R. Lg.—Esmond Ray Long, M.D.** Director, Henry Phipps Institute, Philadelphia, Pa. Director, Division of Research, National Tuberculosis Association Author of *A History of Pathology.*

**E. Ro.—Edward Robertson, D.D.** Librarian, the John Rylands Library, Manchester, Eng. Professor of Semitic Languages and Literature, University of Manchester, Manchester, Eng., 1934–45. Author of *The Old Testament Problem.*

**E. Row.—Eron Rowland (Mrs. Dunbar Rowland).** Consultant, Rowland Historical and Research Library, Jackson, Miss Author of *Andrew Jackson's Campaign Against the British;* etc.

**E. R. Pe.—Elizabeth Robins Pennell.** Author of *Life of Mary Wollstoncraft, Feasts of Autolycus* Co-author of *Lithography and Lithographers.*

**E. R. Pk.—Edson R. Peck.** Associate Professor of Physics, Northwestern University, Evanston, Ill.

**Er. S.—Eric Stone.** Lecturer in History, Manchester University, Manchester, Eng.

**E. R. S.—Sir Edward Raymond Streat.** Chairman, the Cotton Board, Manchester, Eng.

**E. R. T.—E. Raymond Turner.** Professor of European History, The Johns Hopkins University, Baltimore, Md., 1925–29. Author of *The Privy Council of England in the Seventeenth and Eighteenth Centuries.*

**E. Ru.—Ernest Rutherford, 1st Baron Rutherford.** Cavendish Professor of Experimental Physics and Director of Cavendish Laboratory, Cambridge University, 1919–37. Nobel Prize for Chemistry, 1908.

**E. S.—Edward Salmon.** Honorary Editor of *United Empire,* journal of Royal Empire Society, 1941–46, Editor, 1920–37. Author of *Life of General Wolfe; The Story of the Empire;* etc.

**E. Sa.—Edward Sapir.** Former Sterling Professor of Anthropology and General Linguistics, Yale University. Author of *Language, an Introduction to the Study of Speech; Time Perspective in Aboriginal American Culture;* etc.

**E. S. B.—E. S. Bunn.** Assistant Director of Research, Revere Copper and Brass Inc., Rome, N.Y.

**E. S. Ba.—Edson Sunderland Bastin.** Former Chairman of the Department of Geology and Emeritus Professor of Economic Geology, The University of Chicago.

**E. S. Br.—Edwin S. Baker.** Executive Secretary, United States Lawn Tennis Association. Former Editor and Manager, *American Lawn Tennis.* Former Editor of Publications, National Electric Light Association.

**E. Sc.—Emil Schürer.** Former Professor of New Testament Exegesis in the Universities of Giessen, Kiel and Göttingen. Author of *Geschichte des judischen Volkes im Zeitalter Jesu Christi.*

**E. S. F.—Edward Sanborn French.** President, Boston and Maine Railroad, and Maine Central Railroad Company.

**E. Sg.—Eugenie Strong.** Member of Council of Hellenic Society, 1892–1943 Assistant Director of the British School of Archaeology in Rome, 1909–25 Author of *Art in Ancient Rome* ("Ars Una" Series); etc.

**E. S. G.—Eric Stanley Greenaway.** Principal, Yorkshire Residential School for the Deaf, Doncaster, Eng. Formerly editor of *The Teacher of the Deaf.*

**E. S. G. B.—E. S. Guzman Barron, M.D.** Associate Professor of Biochemistry, The University of Chicago Author of *Modern Trends in Physiology and Biochemistry.*

**E. S. Hr.—Ellwood Scott Harrar.** Professor of Wood Technology, Duke University Graduate School of Forestry, Durham, N C. Author of *Forest Dendrology* and *Guide to Southern Trees.*

**E. S. Hs.—Edwin Sherbon Hills.** Professor of Geology and Mineralogy, University of Melbourne, Melbourne, Austr Author of *Outlines of Structural Geology, Physiography of Victoria.*

**E. S. Jn.—Earl Shepard Johnson.** Professor of the Social Sciences, Division of the Social Sciences, The University of Chicago

**E. S. M.—Edwin S. Murphy.** Member of the firm of Kirlin, Campbell, Hickox and Keating, New York, N.Y.

**E. S. P.—Edward S. Prior.** Slade Professor of Fine Arts, Cambridge University, 1912–32 Author of *Eight Chapters on English Mediaeval Art;* etc.

**E. S. R.—Edward Stanley Roscoe.** Registrar of Prize Court, 1914; Official Law Reporter in Admiralty Court, 1883; Admiralty Registrar, 1904; Assessor, North Sea Enquiry, 1905. Author of *Admiralty Law and Practice;* etc.

**E. St.—Miss E. Stevenson.** Inspector of Schools to the London County C[illegible] mer Head Mistress of St. George's School for Girls and St. George's Training College for Secondary Women Teachers, Edinburgh, Scotland.

**E. T.—Edward Tuthill.** Professor of History, University of Kentucky, Lexington, Ky., 1908–45. Author of *Government of Kentucky.*

**E. Ta.—Ethelred Taunton.** Author of *The English Black Monks of St. Benedict; History of the Jesuits in England.*

**E. T. B.—Eric Temple Bell.** Professor of Mathematics, California Institute of Technology, Pasadena, Calif. Author of *Men of Mathematics;* etc.

**E. T. Be.—Elexious Thompson Bell, M.D.** Professor and Head of the Department of Pathology, the Medical School, University of Minnesota Minneapolis, Minn Author of *Text Book of Pathology; Renal Diseases*

**E. T. B. G.—Eric T. B. Gross.** Professor of Electric Power Systems Engineering, Illinois Institute of Technology, Chicago, Ill.

**E. Te.—Edward Teller.** Professor of Physics, Institute for Nuclear Studies, The University of Chicago.

**E. T. F. C.—Sir Edward Thomas Frederick Crowe.** Comptroller General of the British Department of Overseas Trade, 1928–37.

**E. Th.—Edward Thatcher.** Former Instructor in Fine and Applied Arts, Teachers College, Columbia University. Author of *Making Tin Can Toys.*

**E. T. J.—E. Taylor Jones.** Emeritus Professor of Natural Philosophy University of Glasgow, Scotland. Author of *Theory of the Induction Coil;* etc.

**E. T. K.—Edward T. Kennedy.** Coach of Swimming and Water Polo, Columbia University.

**E. Tr.—Ethel Truman.** Bedford College, University of London.

**E. T. W.—Edward Thomas Waters.** Associate Professor of Physiology, University of Toronto, Toronto, Ontario

**Et. W. B.—Ernest Watson Burgess.** Professor of Sociology, The University of Chicago Author of *The Family From Institution to Companionship; Introduction to the Science of Sociology*

**E. T. Ws.—Edgar Trevor Williams.** Brigadier, British Army. Fellow and Tutor, Balliol College, Oxford, 1947– . Chief Intelligence Officer, British 8th Army, 1942–43, and 21st Army Group, 1943–45.

**E. W. Ch.—Edna Woolman Chase.** Editor in Chief, *Vogue*, New York, N Y

**E. Wf.—Eugene Wolff.** Former Ophthalmic Surgeon, Royal Northern Hospital, London Former Surgeon, Loorfields, Westminster and Central Eye Hospital, London Author of *Anatomy of the Eye and Orbit; Diseases of the Eye.*

**E. W. G.—Edward William Golding.** Head of Rural Electrification and Wind Power Department, British Electrical and Allied Industries Research Association Author of *Electrical Measurements and Measuring Instruments; Electrification of Agriculture and Rural Districts.*

**E. W. G. M.—E. W. G. Masterman.** Former Honorary Secretary, Palestine Exploration Fund, London.

**E. W. Hd.—Edward William Herold.** Research Section Head, RCA Laboratories, Princeton, N J.

**E. W. He.—Edgar Wendell Hewson.** Assistant Controller, Research and Training Service, Meteorological Service of Canada, Toronto, Can.

**E. W. Ht.—Edward Weston Hurst, M.D.** Head of the Subdivision of Microorganismal Research, Biological Department, Imperial Chemical (Pharmaceuticals) Ltd, Manchester, Eng.

**E. Wi.—Elizabeth Wiskemann.** Writer on foreign affairs, London Author of *Czechs and Germans; Italy: The Rome-Berlin Axis; Undeclared War.*

**E. W. L.—Ernest Walter Lindstrom.** Professor and Head of Genetics Department and Vice-Dean of Graduate College, Iowa State College of Agriculture and Mechanical Arts, Ames, Ia.

**E. W. MacB.—Ernest William MacBride.** Former Professor of Zoology, Imperial College of Science, South Kensington, London. Strathcona Professor of Zoology at McGill University, Montreal, Can., 1897–1909. Author of *A Text Book of Zoology; Introduction to the Study of Heredity;* etc.

**E. W. M. B.-M.—Evan Whyte Melville Balfour-Melville.** Senior Lecturer in History, University of Edinburgh, Edinburgh, Scot. Author of *James I, King of Scots.*

**E. Wn.—Edward Weston.** Internationally known photographer.

**E. W. P.—Elbridge Woodman Palmer.** President of Kingsport Press, Kingsport, Tenn, 1925–53. Former Associate Editor, *Merriam Webster's Dictionary*. Author of *A Course of Bookbinding for Vocational Schools.*

**E. W. Pe.—Emmett W. Price.** Assistant Head, Zoological Division, U S Bureau of Animal Industry, Department of Agriculture.

**E. Wr.—Sir Edmund Whittaker.** Herbert Spencer Lecturer, Oxford University, 1948– Author of *Modern Analysis;* etc.

**E. W. S.—E. W. Sheppard.** Directorate of Recruiting and Organization, War Office, London

**E. W. Sn.—Ernst W. Swanson.** Research economist, U S. Chamber of Commerce

**E. W. Sz.—Edwin William Schultz, M.D.** Professor of Bacteriology and Experimental Pathology, School of Medicine, Stanford University, Stanford, Calif.

**E. Wt.—Edward Wagenknecht.** Professor of English, Boston University, Boston, Mass Author of *Cavalcade of the American Novel, Cavalcade of the English Novel.*

**E. W. V.—Ernest W. Volkmann.** Assistant Director of Research, Koppers Company, Inc, Pittsburgh, Pa.

**E. W. W.—Rev. Canon Edward William Watson, D.D.** Former Canon of Christ Church College, Oxford, and Regius Professor of Ecclesiastical History in Oxford University.

**E. Wz.—Eugene Willihnganz.** Director of Research, Gould-National Batteries, Inc., St. Paul, Minn.

**E. Y.—Ernest Young.** Former Inspector of Anglo-Vernacular Schools, Siam. Author of *A Peep at Siam;* etc.

**E. Z.—Edwin Ziegfeld.** Head, Department of Fine and Industrial Arts, Teachers College, Columbia University, New York, N Y Co-author of *Art in Daily Living; Art Today.*

**E. Z. V.—Evon Z. Vogt.** Assistant Professor of Social Anthropology, Department of Social Relations, Harvard University. Co-author of *Navaho Means People.*

**F.—Edmund George Fitzmaurice, 1st Baron Fitzmaurice.** Chancellor, Duchy of Lancaster, with a seat in the Cabinet, 1908–09; Undersecretary for Foreign Affairs, 1882–85 and 1905–08.

**F. A. B.—Francis Arthur Bather.** Former Keeper, Department of Geology, British Museum (Natural History), London, 1924–28. Author of "Echinoderma" in Sir Edwin Ray Lankester's *A Treatise on Zoology;* etc.

**F. A. Bh.—Frank A. Beach.** Professor of Psychology, Yale University, 1946– . Chairman and Curator, Department of Animal Behavior, The American Museum of Natural History, New York, N.Y., 1942–46.

**F. A. Bn.—Frank A. Brown, Jr.** Professor of Zoology, Northwestern Univ., Evanston, Ill.

**F. A. Co.—Francis Arthur Cockfield.** Director of Statistics and Intelligence, Board of Inland Revenue, London.

**F. A. E.—Sir F. A. Eaton.** Former Secretary to the Royal Academy.

**F. A. E. C.—F. A. E. Crew, M.D.** Director, Institute of Animal Genetics, University of Edinburgh, Scot, 1921–44. Co-editor of the *British Journal of Experimental Biology.*

**F. A. F.—Frank Albert Fetter.** Former Professor of Political Economy, Princeton University, Princeton, N.J. Author of *Economic Principles;* etc.

**F. A. G.—F. A. Gould.** Senior Principal Scientific Officer, Metrology Division, National Physical Laboratory, Teddington, Middlesex.

**F. A. G. W.—Frederick Andrew Graves Willis.** Rector of Bagenalstown, Ire.

**F. A. I.—Frederick A. Irving.** Superintendent, U S Military Academy, West Point, N Y.

**F. A. Js.—Francis Arthur Jenkins** Professor of Physics, University of California, Berkeley, Calif. Author of *Fundamentals of Physical Optics.*

**F. A. K.—Forrest Alva Kingsbury.** Associate Professor Emeritus, Department of Psychology, The University of Chicago Co-author of *Psychological Tests in Business.*

**F. Al.—Frederick Allemes.** French advocate.

**F. A. Lz.—Friedrich A. Lutz.** Professor, University of Zürich, Zurich, Switz Author of *The Theory of Investment of the Firm.*

**F. A. M.—Frank Anderson Merrick.** Vice-Chairman, 1938–44, and President, 1929–38, of Westinghouse Electric and Manufacturing Company.

**F. B. Mt.—Fred B. Millett.** Olin Professor of English Literature and Director of the Honors College, Wesleyan University, Middletown, Conn. Author of *Contemporary American Authors; The Rebirth of Liberal Education.*

**F. B. My.—Francis B. Mahoney.** District Anthropologist, Palau District, Trust Territory of the Pacific Islands.

**F. Bn.—Sir Frank Brangwyn.** Artist. President of Graphic Arts Society, England.

**F. Boo.—Franklin Booth.** Illustrator, painter.

**F. Bra.—Frederick [illegible] Freeman** of the Company of Cu[illegible], England. Author of *History of Old Sheffield Plate;* etc.

**F. B. Sr.—Francis B. Sumner.** Former Professor of Biology, Scripps Institution of Oceanography, University of California, La Jolla, Calif

**F. B. St.—Florence Barbara Seibert.** Associate Professor of Biochemistry, Henry Phipps Institute, University of Pennsylvania, Philadelphia, Pa

**F. B. T.—Frederick B. Tolles.** Member of Permanent Research Group, Huntington Library, San Marino, Calif Author of *Meeting House and Counting House: The Quaker Merchants of Colonial Philadelphia.*

**F. Bu.—Fred Bullock.** Former Secretary and Registrar, Royal College of Veterinary Surgeons, London Author of *Handbook for Veterinary Surgeons;* etc.

**F. Buc.—Francis Buckley.** Author of *History of Old English Glass; Old London Glasshouses.*

**F. B. W.—Frank B. Willis.** Former U.S. Senator from Ohio.

**F. B. Wy.—Francis Bowditch Wilby.** Major General, U.S. Army (retired) Superintendent, United States Military Academy, West Point, N Y, 1942–45.

**F. C.—F. Clements.** General Manager, the Park Gate Iron and Steel Company, Ltd., Rotherham, England.

**F. Ca.—Florian Cajori.** Former Professor of History of Mathematics, University of California. Author of *A History of Mathematics;* etc.

**F. C. B.—Francis Crawford Burkitt, D.D.** Former Fellow of Trinity College, Cambridge. Norrisian Professor of Divinity in Cambridge University, 1905–35.

**F. C. Ba.—Frederic Charles Bartlett.** Professor of Experimental Psychology, and Director of the Psychological Laboratory, Cambridge University.

**F. C. Bd.—Frederick Charles Bradford.** Senior Horticulturist, Bureau of Plant Industry, Soils, and Agricultural Engineering, U.S Department of Agriculture, Glenn Dale, Md. Co-author of *Fundamentals of Fruit Production;* etc.

**F. C. Bo.—Frank C. Bowen.** Editor of *Merchant Ships of the World.* Author of *The Golden Age of Sail;* etc.

**F. C. Br.—Frederick Charles Bauer.** Professor of Soil Fertility, University of Illinois, Urbana, Ill.

**F. C. C.—Frederick Cornwallis Conybeare.** Former Fellow of University College, Oxford, and of the British Academy. Author of *The Ancient Armenian Texts of Aristotle;* etc.

**F. C. F.—Francis Cowles Frary.** Director of Research, Aluminum Company of America, New Kensington, Pa. Co-author of *The Aluminum Industry.*

**F. C. H.—Frederic Clare Hawkes.** Secretary, the Chartered Auctioneers' and Estate Agents' Institute, London.

**F. C. Kk.—Frank Charles Kracek.** Physical Chemist, Geophysical Laboratory, Carnegie Institution of Washington, Washington, D.C.

**F. C. L.—Frederick C. Lincoln.** Assistant to the Director, Fish and Wildlife Service, U S. Department of the Interior, Washington, D C

**F. C. Mn.—Frank Charles Mann, M.D.** Professor of Experimental Medicine, Mayo Foundation, University of Minnesota, Rochester, Minn

**F. C. R. J.—Rev. Francis C. R. Jourdain.** Former Member of the British Ornithological Union, Former Honorary Fellow, American Ornithological Union.

**F. C. Sd.—F. C. Steward.** Research Associate in Botany, The University of Chicago, 1945–48. Reader in Botany, University of London.

**F. C. Si.—Frederick Cameron Sillar.** Principal Assistant Secretary, Imperial War Graves Commission, London, Eng

**F. C. S. S.—Ferdinand Canning Scott Schiller.** Former Fellow and Senior Tutor of Corpus Christi College, Oxford. Author of *Formal Logic; Humanism;* etc.

**F. Ct.—François Marie-Joseph Crouzet.** Assistant à la Sorbonne, Paris University. Author of *L'Economie du Commonwealth Britannique.*

**F. C. Wh.—Frank Clifford Whitmore.** Former Dean of the School of Chemistry and Physics, The Pennsylvania State College, State College, Pa. Author of *Organic Chemistry; Organic Compounds of Mercury.*

**F. D.—Sir Frank Watson Dyson.** Astronomer Royal of England, 1910–33.

**F. Da.—Frederick Dalgas.** Managing Director of The Royal Copenhagen Porcelain Manufactory.

**Fd. C.—Floyd Clymer.** Publisher of books relating to automobiles, motorcycles and motor racing. Author of *Treasury of Early American Automobiles.*

**F. De.—Frank Debenham.** Professor of Geography, Cambridge University, 1930– . Founder and Director of Scott Polar Research Institute, 1925–46. Former Editor, *The Polar Record.*

**F. De C.—Francis De Crue.** Rector of the Université de Genève, Geneva, Switz., 1916–18. Author of *La guerre féodale de Genève et l'établissement de la Commune (1285-1320);* etc.

**F. D. G.—Frank D. Graham.** Walker Professor of International Finance, Princeton University, 1930–49. Author of *Protective Tariffs;* etc.

**F. D. L.—Frank D. Lamb.** Chief, Ore Dressing Section, U.S. Bureau of Mines, College Park, Md.

**F. D. N.—F. D. Nichol.** Editor, *Review and Herald,* Washington, D.C. Author of *The Midnight Cry; The Answer to Modern Religious Thinking;* etc.

**F. D. P.—Frederick Douglas Patterson.** President, Tuskegee Institute, Tuskegee Institute, Ala. Co-author of *What the Negro Wants.*

**F. D. Pe.—Francis Douglas Price.** Dean, Fellow and Tutor, Keble College, Oxford.

**F. D. R.—Frank Driver Reeve.** Associate Professor of History, University of New Mexico, Albuquerque. Editor, *New Mexico Historical Review.*

**F. D. S.—Franklin D. Scott.** Professor of History, Northwestern University, Evanston, Ill. Author, *Bernadotte and the Fall of Napoleon;* etc.

**F. D. Sh.—F. D. Smith.** Assistant Director, Development Department, Organic Chemicals Division, Monsanto Chemical Co., St. Louis, Mo.

**F. D. W.—Florence Dahl Walrath.** Founder and Managing Director, Cradle Society, Evanston, Ill.

**F. E.—Fritz Ernst.** Professor of German Literature, Swiss Federal Institute of Technology. Professor of Comparative Literature, University of Zurich, Zürich, Switz.

**Fe. C.—Felix Cole.** U.S. Minister to Ethiopia, 1945–47.

**F. E. Ci.—Francis Edward Cislak.** Director of Research, The Reilly Tar and Chemical Corporation. Indianapolis, Ind.

**F. E. D.—F. E. Drury.** Former Principal, London County Council School of Building, London.

**F. E. F.—Felix Eugen Fritsch.** Former Head of Department of Botany, Queen Mary College, London Author of *An Introduction to the Study of Plants;* etc.

**F. E. L.—Francis Ernest Lloyd.** Emeritus Professor of Botany, McGill University, Montreal, Que Co-author of *The Teaching of Biology in the Secondary School* ("American Teachers Series"); *Guayule, A Rubber Plant of the Chihuahuan Desert;* etc.

**F. E. M.—F. E. Matthews.** Former Professor of Chemistry at the Royal Indian Civil Engineering College (Cooper's Hill College), Egham, England.

**F. E. Mn.—Francis Elmer McMahon.** Associate Professor of Philosophy, The University of Chicago. Former President, American Catholic Philosophical Association, and Catholic Association for International Peace.

**F. E. S. J.—F. E. Skone James.** Of Lincoln's Inn. Barrister-at-Law.

**F. E. Wa.—Rev. Frederick Edward Warren.** Hon. Canon of Ely, 1906–14. Author of *The Liturgy and Ritual of the Ante-Nicene Church;* etc.

**F. F.—Ferdinand Foch.** Former Marshal of France. Commander in Chief of the Allied Armies in France, World War I. Author of *The Memoirs of Marshal Foch.*

**F. F. Dg.—Frank Fraser Darling.** Senior Lecturer in Geology and Conservation, University of Edinburgh, Edinburgh, Scot. Author of *A Herd of Red Deer; Natural History in the Highlands and Islands.*

**F.-F. Ds.—Fanny-Fern Davis.** Acting Director, U.S. Golf Association Green Section.

**F. F. G.—Frank F. Grout.** Visiting Professor of Geology, California Institute of Technology, Pasadena, Calif. Author of *Kemp's Handbook of Rocks; Petrography and Petrology.*

**F. Fl.—Fred Fletcher.** Sporting Department, *New York Herald Tribune.*

**F. F. Rx.—Frederick Ferdinand Rex.** Librarian, Municipal Reference Library, Chicago, Ill. Author of *The Alderman's Manual; The Mayors of the City of Chicago from March 4, 1837, to April 13, 1933.*

**F. G.—Frank Gahan.** Editor of tenth edition, *Mayne's Treatise on Damages.*

**F. C.—Frederick Carmen Bonnell.** Former Technical Consultant, Research Corporation, New York, N Y Consulting Chemist, Bureau of Plant Industry, 1940–43, Bureau of Chemistry and Soils, 1930–40, U S. Dept of Agriculture

**F. G. H.—Sir Frederick Gowland Hopkins, Hon. M.D.** Professor of Biochemistry in Cambridge University, 1914, Sir William Dunn Professor, 1921–43. Nobel Prize for Medicine, 1929.

**F. G. H. T.—Francis G. H. Tate.** First Class Chemist, British Government Chemist's Department, London.

**F. G. M.—Frank Grant Menke.** Author of *Encyclopedia of Sports; Down the Stretch;* etc.

**F. G. M. B.—Frederick George Meeson Beck.** Former Fellow and Lecturer of Clare College, Cambridge

**F. G. Me.—F. G Merkle.** Professor of Soils, Pennsylvania State College, State College, Pa

**F. G. P.—Frederick Gymer Parsons.** Former Research Fellow in Anthropology, St Thomas's Hospital, London

**F. G. U.—F. G. Underhay.** Editor of the Official *Reports of Patent, Design and Trade-Mark Cases* Editor of *Kerly on Trade Marks*

**F. G. W.—Francis Graham Wilson.** Professor of Political Science, University of Illinois, Urbana, Ill Author of *The Elements of Modern Politics,* etc.

**F. H.—Fred Horner.** Consulting engineer Contributor to *The Times, Engineering Supplement,* London, *Engineering,* etc

**F. Ha.—Francis Harper.** Research Associate, John Bartram Association, and of the Morris Arboretum, University of Pennsylvania, Philadelphia, Pa

**F. H. A. M.—Francis Hugh Adam Marshall.** Reader in Agricultural Physiology, 1919–43, and Dean, 1926–36, Christ's College, Cambridge. Author of *The Physiology of Reproduction;* etc.

**F. H. An.—Frederick Harold Allen, M.D.** Medical Director, Philadelphia Child Guidance Clinic, Philadelphia, Pa Associate Professor of Psychiatry University of Pennsylvania, Philadelphia. Author of *Psychotherapy with Children.*

**F. Har.—Frederic Harrison.** Author of *De Senectute; Life of Ruskin;* etc.

**F. H. B.—Francis H. Butler.** Associate of the Royal School of Mines, Imperial College of Science and Technology, University of London.

**F. H. Br.—Sir Frank Herbert Brown.** On the Editorial Staff of *The Times,* London. Former Editor of the *Indian Daily Telegraph.*

**F. H. C.—Fred Herbert Colvin.** Consultant, U S Navy Bureau of Aeronautics. Emeritus Editor, *American Machinist* Co-author of *American Machinists' Handbook; Aircraft Handbook;* etc

**F. Hd.—Frank Lloyd Hopwood.** Former Vice-Dean, Professor of Physics, St Bartholomew's Hospital Medical College, University of London.

**F. H. D.—Francis H. Dowley.** Assistant Professor, Department of Art, The University of Chicago.

**F. He.—Friedrich Hempelmann.** Former Professor of Zoology, University of Leipzig, Germany

**F. Hed.—Frank Hedley.** Former President and General Manager, Interborough Rapid Transit Company, New York, N.Y.

**F. H. Ba.—Frank Harmon Baldwin.** Former Editor in Chief of *Encyclopædia Britannica*

**F. H. Ha.—Frederick Henry Hatch.** Former President, Institute of Mining and Metallurgy, London Author of *The Iron and Steel of the U K. under War Conditions;* etc

**F. H. K.—Frank Hyneman Knight.** Professor of Social Sciences and of Philosophy, The University of Chicago. Author of *Risk, Uncertainty and Profit; The Economic Order and Religion;* etc.

**F. H. Kn.—Frank Hammond Krusen, M.D.** Head of Section on Physical Medicine, Mayo Clinic, Rochester, Minn Professor of Physical Medicine, Mayo Foundation of the University of Minnesota, Minneapolis, Minn. Co-author of *Physical Medicine*

**F. H. M.—Frederick Henry Marshall.** Koraes Professor of Modern Greek and Byzantine History, Language and Literature, King's College, University of London.

**F. How.—F. Howarth.** Lecturer in Botany, Imperial College of Science and Technology, University of London.

**F. H. P.—Frederick Henry Pollard.** Senior Lecturer in Inorganic Chemistry, University of Bristol, Bristol, Eng

**F. Hr—Friedrich Hrozny.** Former Professor of Cuneiform Writing and History of the Ancient Orient, Charles University, Prague, Czech Conducted excavations at Cheikh-Saad, Tell-Erfad and Kultepe Author of *Das Getreide im Alten Babylonien* Editor of *Hethitica* and *Archiv Orientální.*

**F. Hs.—Fritz Haas.** Curator of Lower Invertebrates, Chicago Natural History Museum, Chicago, Ill, 1939–

**F. H. S.—Frederick Hanley Seares.** Research Associate of Mount Wilson Observatory of Carnegie Institution, Washington, D C, 1940–46 Author of *Practical Astronomy for Engineers;* etc Collaborating Editor, *Astrophysical Journal.*

**F. H. Sl.—Frank Harvey Snoxell.** Assistant Editor, *The Motor Boat and Yachting.* Author of *Motor Boating;* co-author of *The Motor Boat and Yachting Manual*

**F. H. Sp.—Frank Harold Spedding.** Professor of Chemistry and Physics and Director of the Institute for Atomic Research, Iowa State College, Ames, Iowa, 1942– Member, Board of Governors, Argonne National Laboratory, Chicago, Illinois.

**F. Hu.—Francis Hueffer.** Former Musical Critic of *The Times,* London, and Editor of *Great Musicians* Author of *Richard Wagner and the Music of the Future.*

**F. H. Wr.—Frank Henry Westheimer.** Professor of Chemistry, The University of Chicago.

**F. I. W.—F. I. Watson.** Sports Editor of *The Field,* London

**F. J. A.—Frederick J. Adams.** Professor and Head of the Department of City and Regional Planning, Massachusetts Institute of Technology, Cambridge, Mass.

**F. J. B.—Frank John Bruno.** Professor of Applied Sociology and Chairman of the Department of Social Work, Washington University, St. Louis, Mo. Consulting Editor, *Social Science Abstracts; Encyclopedia of Social Sciences.*

**F. J. B. W.—Francis John Bagott Watson.** Assistant Director, Wallace Collection, London Assistant Surveyor of the Queen's Works of Art. Author of *Canaletto; Catalogue of Furniture.*

**F. J. C.—Felix John Clewett** Chief General Manager, Great Western Railway, London, 1921–29.

**F. J. D.—F. J. Drover.** Engineer Captain Royal Navy. Author of *Marine Engineering Practice;* etc

**F. J. G. Du.—Frank J. G. Duck.** Of the Worthington Pump and Machinery Corporation, New Jersey Co-author of 6th edition of *Coal Miner's Handbook.*

**F. J. H.—Francis John Haverfield.** Former Camden Professor of Ancient History, Oxford University.

**F. J. H. D.—F. J. Harvey Darton.** Sometime Scholar of St John's College, Oxford.

**F. J. H. M.—Hon. Frederick James Hamilton Merrill.** Consulting geologist and mining engineer State Geologist of New York, 1899–1903 Author of *Reports* of New Jersey and New York Geological Surveys, etc.

**F. J. Hn.—Frederick J. Hoffman.** Associate Professor of English, University of Wisconsin Madison Wis Author of *Freudianism and the Literary Mind;* co-author of *The Little Magazine*

**F. J. Hu.—F. J. Hudleston.** Former Librarian, War Office London.

**F. J. M.—Fred J. Miller.** Author of *American and European Machinery Abroad.* Former Editor *American Machinist*

**F. J. McC.—Francis John McConnell, D D.** Former Senior Bishop of the Methodist Episcopal Church Author of *The Divine Transcendence;* etc.

**F. J. Mn.—Frederick Justin Mann.** Organization and Methods Examiner, Bureau of Security and Consular Affairs, U S Department of State, Washington, D C. Co-author of *Creation of Rights of Sovereignty Through Symbolic Acts 1400–1800.*

**F. J. N.—Frederick J. North.** Keeper of the Department of Geology, National Museum of Wales Cardiff

**F. J. O.—Frances Jenkins Olcott.** Organizer and former Director of Training School for Children's Librarians, Carnegie Library, Pittsburgh, Pa. Author of *The Children's Reading;* etc.

**F. J. P.—F. J Pettijohn.** Professor of Geology, The Johns Hopkins University, Baltimore, Md. Author of *Sedimentary Rocks.*

**F. J. S.—Frederick J. Stevenson.** Geneticist, Bureau of Plant Industry, Soils, and Agricultural Engineering, U S. Department of Agriculture.

**F. J. Se.—Frederick J. Stare, M.D.** Professor and Chairman of the Department of Nutrition, Harvard School of Public Health, Boston, Mass

**F. J. Sr.—Fred Jay Seaver.** Head Curator, New York Botanical Gardens. Editor of *Mycologia,* official organ of Mycological Society of America.

**F. J. T.—Frederick Jackson Turner.** Former Professor of History, Harvard University. Author of *Rise of the New West;* etc.

**F. J. W.—Frank John Wilson.** Chief, U S. Secret Service, Treasury Department. Washington, D C, 1936–46.

**G. M. A. R.—Gisela Marie Augusta Richter.** Curator of the Greek and Roman Department, Metropolitan Museum of Art, New York, N Y Author of *Catalogue of Engraved Gems of the Classical Style in the Metropolitan Museum of Art;* etc.

**G. Mc.—Gilbert McAllister.** Member of Parliament Co-author of *Town and Country Planning;* joint editor of *Homes, Towns and Countryside.*

**G. M. Ca.—Gerald M. Capers.** Professor and Chairman of the Department of History, H. Sophie Newcomb Memorial College for Women, Tulane University, New Orleans, La. Author of *Biography of a River Town.*

**G. M. Ce.—Gerald M. Clemence.** Senior Astronomer, U S Naval Observatory, Washington, D C.

**G. McL. Wo.—George McLane Wood.** Editor, U S Geological Survey, Washington, D C., 1886–1925 Author of *Texts* for U.S. Geological Survey, etc.

**G. M. Cs.—George M. Curtis, M.D.** Professor of Surgery, Ohio State University, Columbus, O.

**G. M. D.—George McMillan Darrow.** Bureau of Plant Industry, Soils, and Agricultural Engineering, U S. Department of Agriculture, Beltsville, Md., 1911– . Senior Pomologist in charge of Small Fruit Investigations. Editorial board of *Journal of Heredity.*

**G. M. Dk.—Gail M. Dack, M.D.** Director, Food Research Institute, The University of Chicago Author of *Food Poisoning.*

**G. M. G.-H.—Geoffrey Malcolm Gathorne-Hardy.** Author of *The Norse Discoverers of America; Norway; A Short History of International Affairs, 1920–39.*

**G. Mh.—Geoffrey Mott-Smith.** Editor of *The Bridge World,* 1936–46. Editor of *Games Digest,* 1938–39. Author of *Mathematical Puzzles;* etc.

**G. Mi.—Rev. [illegible]** Professor [illegible] Biblical Criticism in the University of Chicago, 1906–34. Author of *The Theology of the Epistle to the Hebrews;* etc.

**G. Ml.—Gabriel Marcel.** Dramatist and literary critic for *L'Europe nouvelle* Author of *Studies on Contemporary English and American Philosophers*

**G. M. McB.—George McCutchen McBride.** Professor of Geography, University of California, Los Angeles. Visiting Professor, Carnegie Endowment for International Peace, South America, 1929–30; Central America, 1938. Author of *Agrarian Indian Communities of Highland Bolivia;* etc.

**G. M. S.—Gilbert Morgan Smith.** Professor of Botany, Stanford University, Stanford, Calif.

**G. M. S. S.—George Marquis Stewart Stitt.** Commander, Royal Navy (retired). Cabinet Office Historian, Great Britain. Author of *H M S. Wideawake; A Prince of Arabia; Under Cunningham's Command.*

**G. M. T.—Galen M. Taylor.** Lieutenant Colonel, Ordnance Department, U.S. Army.

**G. M. W.—George Mackinnon Wrong.** Former Professor of History, University of Toronto, Canada.

**G. M. Ws.—George Michael Wickens.** University Lecturer in Arabic, Cambridge.

**G. N. C.—George Norman Clark.** Provost of Oriel College, Oxford, 1947– . Chichele Professor of Economic History and Fellow of All Souls College, Oxford, 1931–43 Regius Professor of Modern History Cambridge University, 1943–47 Author of *The Dutch Alliance and the War Against French Trade;* etc

**G. N. H.—George N. Halm.** Professor of Economics, Tufts College, Medford, Mass ; Professor of International Economic Relations, Fletcher School of Law and Diplomacy, Tufts College Author of *International Monetary Co-operation;* etc.

**G. N. W.—George Neville Watson.** Professor of Mathematics, University of Birmingham, England. Author of *The Theory of Bessel Functions*

**G. O'B.—George O'Brien.** Professor of Political Economy, University College, Dublin Author of *The Economic History of Ireland (1800–47),* etc.

**Go. P.—Gordon Pall.** Professor of Mathematics, Illinois Institute of Technology, Chicago, Ill.

**G. P. Br.—G. P. Broomhall.** Editor of *Corn Trade News,* Manchester, England.

**G. P. DuS.—Graham Phillips DuShane.** Professor of Biology, Stanford University, Stanford, Calif.

**G. P. E.—George Pearse Ennis.** Former member, American Water Color Society. Guild of American Painters, Society of Painters, etc.

**G. P. J.—Gwilym Peredur Jones.** Professor of Economics, University of Sheffield, Sheffield, Eng Co-author of *The Mediaeval Mason.*

**G. P. M.—George Percival Mudge.** Former Professor and Head of the Department of Zoology, East London College (now Queen Mary College), University of London.

**G. P. P.—Gilbert Paul Phillips.** Assistant Director, Bureau of Agricultural Economics, Canberra, Austr

**G. P. T.—George Philip Thomson.** Reader in the Royal Naval Public Relations Officer Hispanic Counter and Luso-Brazilian Council, London Chief Press Censor, Ministry of Information, London, 1940–45 Author of *Blue Pencil Admiral.*

**G. R. B.—George Reginald Balleine.** Honorary Librarian, Société Jersaise. Jersey, Channel Islands Author of *The Bailiwick of Jersey; Biographical Dictionary of Jersey, History of Jersey.*

**G. R. C.—George Rowland Collins.** Professor of Marketing and Dean, Graduate School of Business Administration, University College of Arts and Pure Science, New York University Author of *Marketing; An Outline of Business;* etc

**G. R. D.—Godfrey Rolles Driver.** Grinfield Lecturer on the Septuagint, Oxford University, 1935–39. Professor of Semitic Philology, 1938.

**G. R. de B.—Gavin Rylands de Beer.** Professor of Embryology, University College, University of London. Former Head of Department of Anatomy and Embryology Jenkinson Lecturer in Embryology, 1927–38, and Senior Demonstrator in Zoology, Oxford University, 1926–38. Author of *Vertebrate Zoology; Embryos and Ancestors;* etc.

**G. Re.—Sir George Reid.** Scottish artist.

**G. R. F. B.—G. R. F. Bredin.** Fellow and Bursar of Pembroke College, Oxford, 1950– . Governor of Blue Nile Province, Anglo-Egyptian Sudan, 1941–48.

**G. R. P.—George Richard Potter.** Professor of Modern History, University of Sheffield, Sheffield, Eng Author of *The [illegible] of Ousama; Short History of Scandinavia; Sir Thomas Mac.*

**Gr. P. B.—Gregory Paul Baxter.** Former Theodore William Richards Professor of Chemistry, Harvard University.

**G. R. R.—G. R. Rudolf.** Average adjuster Co-editor of *Loundes' Law of General Average.*

**G. Rs.—Graham Reynolds.** Deputy Keeper, Department of Paintings, Victoria and Albert Museum, London. Author of *English Portrait Miniatures; Nicholas Hilliard and Isaac Oliver.*

**G. R. S.—George Robert Stibitz.** Consultant in Applied Mathematics, University of Vermont, Burlington, Vt.

**Gru.—M. Gruson.** General Secretary, Compagnie des Chemins de Fer de l'Est, Paris

**G. S.—Grant Showerman.** Professor of Latin in the University of Wisconsin, Madison, Wis, 1900–35. Author of *The Great Mother of the Gods.*

**G. Sa.—George Edward Bateman Saintsbury.** Essayist and critic Former Professor of Rhetoric and English Literature at Edinburgh University Author of *Essays on French Novelists;* etc.

**G. Sar.—George Sarton.** Associate of the Carnegie Institution of Washington, D C. Lecturer on History of Science, Harvard University. Author of *Introduction to the History of Science;* etc.

**G. S. Bd.—George Samuel Blanchard.** Major, U S Army. Assistant to the Chairman, Joint Chiefs of Staff.

**G. Sc.—Paul Gerhard Schott.** Oceanographer, German Naval Observatory, Hamburg. Honorary Professor of Oceanography, University of Hamburg.

G. S. C.—George Stephens Clarke, 1st Baron Sydenham of Combe. Author of *Imperial Defence; Russia's Sea Power, The Last Great Naval War.*

G. S. Co.—G. S. Coleman. Lecturer in Sanitary Engineering and in the Faculties of Bacteriology, and Preventive Medicine and Technology, Victoria University of Manchester, England.

G. S. Cr.—George Stuart Carter. Fellow of Corpus Christi College, Cambridge, and Lecturer in Zoology, Cambridge University

G. S. F.—George Sutherland Fraser. Journalist and broadcaster. Author of British Council Pamphlet on W B Yeats, *The Modern Writer and His World.*

G. S. G.—Rev. George Stanislaus Glanzman, S.J. Assistant Editor, *Theological Studies*

G. S. J.—Gilbert Starling Jones. Executive Vice-President and Treasurer, Valley Forge Historical Society, Valley Forge, Pa. Author of *Valley Forge Park, An Historical Record and Guide.*

G. S. L.—George Somes Layard. Author of *Charles Keene, Shirley Brooks,* etc

G. S. P.—George Smith Pryde. Reader in Mediaeval Scottish History, University of Glasgow, Glasgow, Scot Author of *The Treaty of Union, 1707;* co-author of *Scotland.*

G. Ste.—George Stevenson, M.D. Medical Director, the National Committee for Mental Health, Inc Co-author of *Child Guidance Clinics*

G. S. W.—Graham Selby Wilson, M.D. Professor of Bacteriology as applied to Hygiene, University of London Author of *The Bacteriological Grading of Milk* and *The Pasteurization of Milk*

G. S. W. E.—Sir George Selby Washington Epps. Actuary, Government Actuary's Department, London, 1936–44; Deputy Actuary, 1926–36

G. S. Ws.—Gertrude S. Weiss. Home Economist, Agricultural Research Service, U S. Department of Agriculture, Washington, D C.

G. T. A.—G. T. Atkinson. Superintending Inspector, Animal Health Division, Ministry of Agriculture and Fisheries, England

G. T. B.—George Thomas Burrows. Editor of the *Live Stock Journal,* 1915–33

G. T. Bs.—Gordon T. Bowles. Professor of Anthropology, University of Tokyo, Tokyo, Japan Author of *New Types of Old Americans at Harvard and Eastern Women's Colleges.*

G T. Ft.—George Tobias Faust. Mineralogist, Section of Geochemistry and Petrology, Geological Survey, U S Department of the Interior

G. T. G.—Sir George Taubman Goldie. Former English Administrator and Founder of Nigeria.

G. T. M.—Sir Gilbert Thomas Morgan. Director, Chemical Research Laboratory, Department of Scientific and Industrial Research, London, 1925–38. Former Mason Professor of Chemistry, University of Birmingham. Author of *Inorganic Chemistry;* etc.

G. T. N.—Gordon Thayer Nightingale. Physiologist, Hawaiian Pineapple Company, Honolulu, Hawaii.

G. T-P.—Gabriel Turville-Petre. Vigfússon Reader in Ancient Icelandic Literature and Antiquities, Oxford University Author of *The Heroic Age of Scandinavia; Origins of Icelandic Literature.*

G. T. Pk.—George T. Pack, M.D. Clinical Professor of Surgery, New York Medical College, New York, N Y Associate Professor of Clinical Surgery, Cornell University Medical School, New York, N Y attending Surgeon, Memorial Center for Cancer and Allied Diseases, New York, N Y Author of *End Results in Cancer of the Stomach;* etc.

G. Tr.—Griffith Taylor. Head of Department of Geography, University of Toronto, Canada Former Professor of Geography, University of Sydney, Australia Author of *Australian Meteorology, Australia,* etc

G. T. S.—George T. Springer. President, National Rodeo Association

G. T. Sg.—Glenn Theodore Seaborg. Professor of Chemistry and Director of Chemical Research, Radiation Laboratory, University of California, Berkeley, Calif Member, General Advisory Committee of the U S Atomic Energy Commission, 1946– Co-recipient of the Nobel Prize in Chemistry, 1951.

G. T. W.—Sir Gilbert Thomas Walker. Professor of Meteorology, Imperial College of Science and Technology, University of London, 1924–34 Director General of Indian Observatories, 1904–24 Fellow of Trinity College, Cambridge, 1891. Author of *Aberration; The Theory of Electromagnetism;* etc.

G. V.—Gérard Vidalenche. Financial Editor, *La Vie Française*

G. V. C.—George V. Caesar. Laboratory Director, Stein, Hall and Company, Inc, New York, N Y.

G. v. E.—Guenther von Elbe. Physical Chemist, Bureau of Mines, U S Department of the Interior Co-author of *Combustion, Flames and Explosions of Gases.*

G. V. M.—George Vernon Mueller. Professor of Electrical Engineering, Purdue University, Lafayette, Ind Author of *Alternating Current Machines; Introduction to Electrical Engineering*

G. W.—Geoffrey White. Major General. Director of Remounts, War Office, England, 1925–29 Colonel Commandant, Woolwich Sub-Area, 1920–23

G. W. A.—Gay Wilson Allen. Professor of English, New York University, New York, N Y Author of *American Prosody; Walt Whitman Handbook.* Co-editor of *Pope to Croce*

G. W. B.—George William Bartelmez. Emeritus Professor of Anatomy, The University of Chicago.

G. W. B. H.—George Wynn Brereton Huntingford. Lecturer in East African Languages and Cultures, School of Oriental and African Studies, University of London. Author of *The Nandi of Kenya: Tribal Control in a Pastoral Society; Nandi Work and Culture.*

G. W. C.—Graham W. Corddry. Director, Titanium Pigment Corporation, New York, N Y.

G. W. Cb.—George Watson Cobb, Jr. Formerly with the American Can Company, New York, N Y.

G. W. Cr.—George Washington Corner. Director, Department of Embryology, Carnegie Institution of Washington, D C. Professor of Anatomy, University of Rochester, Rochester, N Y, 1923–40. Author of *Ourselves Unborn;* etc.

G. W. Cu.—G. W. Cussons. Of the firm of Messrs. G. Cussons, Ltd, makers of scientific and technical apparatus for education, research and industry, Manchester, England.

G. W. D.—George Walter Dawson, [illegible] Fine Arts University of Pennsylvania, Philadelphia Pa

G. W. Do.—George William Douglas. Former Associate Editor of the *Evening Public Ledger* and of the *Philadelphia Public Ledger* Author of *The American Book of Days,* etc.

G. W. G.—George W. Giles. Secretary of the Allotments Organization Society and Small Holders, Ltd.

G. W. Gi.—George Waters Gilbertson. Author of *The Balochi Language,* etc.

G. W. Go.—George Washington Goethals. Former Instructor in Civil and Military Engineering, U S Military Academy, West Point, N Y Chief Engineer, Panama Canal, 1907–14 Civil Governor, Panama Canal Zone, 1914–16. State Engineer, New Jersey, 1917.

G. W. H.—George William Heise. Research Chemist, National Carbon Company, Cleveland, O.

G. W. K.—George Williams Keeton. Professor of English Law and Dean, Faculty of Laws, University College, University of London Editor of *The Cambridge Review,* 1924 Author of *The Elementary Principles of Jurisprudence,* etc.

G. W. Ki.—George W. Kirchwey. Head of the Department of Criminology, New York School of Social Work, 1917–32 Warden of Sing Sing Prison, 1915–16 Author of *Readings in the Law of Real Property.*

G. W. Kn.—Rev. George William Knox, D.D. Former Professor of Philosophy and History of Religion, Union Theological Seminary, New York, N Y. Author of *The Direct and Fundamental Proofs of the Christian Religion;* etc

G. W. O.—Gerrit Willem Overdijkink. Expert on southeast Asian affairs.

G. W. R.—George William Redway. Author of *The War of Secession, 1861–62; Fredericksburg: A Study in War.*

G. W. Ri.—George Warren Richards, D.D. President, the Theological Seminary of the Reformed Church in the United States, Lancaster, Pa. Author of *Christian Ways of Salvation,* etc.

G. W. S.—Geoffrey William Shaw. Former Assistant Lecturer in Geography, University College, London

G. W. Sr.—George W. Schaeffer. Associate Professor and Director of the Department of Chemistry, St. Louis University, St. Louis, Mo

G. W. T.—Rev. Griffiths Wheeler Thatcher. Warden of Camden College, Sydney, N S W. Former Tutor in Hebrew and Old Testament History at Mansfield College, Oxford.

G. W. Tr.—Sir George Wilfred Turner. Permanent Under-Secretary of State for War, Great Britain, formerly Second Secretary, Ministry of Supply.

G. W. Wd.—George Willard Wheland. Professor of Chemistry, The University of Chicago. Author of *The Theory of Resonance; Advanced Organic Chemistry.*

G. W. Wi.—George Woodward Wickersham. Attorney-General of the United States, 1909–13.

G. Yo.—Sir George John Younghusband. Major General. Former Keeper of the Jewel House, Tower of London. Author of *The Jewel House;* etc.

**Gy. T.—Geoffrey Templeman.** Lecturer in History, University of Birmingham, Birmingham, Eng

**H. A.—Harrison Atwood.** Chairman of the Executive, Committee, Vice-President and Director, [illegible] New York, N.Y.

**H. A. Ar.—Hans A. Adler.** Executive Office of the President, Bureau of the Budget, Washington, D C.

**H. A. B.—Harry Arnold Baylis.** Deputy Keeper, Department of Zoology, British Museum (Natural History), London.

**H. A. Be.—Hans Albrecht Bethe.** Professor of Physics, Cornell University, Ithaca, N.Y. Author of *Elementary Nuclear Theory.*

**H. A. Cs.—Harry Alfred Curtis.** Dean, College of Engineering, University of Missouri, Columbia, Mo.

**H. A. Cw.—H. A. Caddow.** Secretary-Manager, Wine Institute, San Francisco, Calif.

**H. A. Dr.—Hugh A. Drum.** Lieutenant General, formerly with U S. Army. Chief of Staff, 1st Army, A E.F., 1918–19.

**Ha. F.—Harvey Fletcher.** Director of Physical Research, Bell Telephone Laboratories, Murray Hill Laboratory, Murray Hill, N.J.

**H. Ah.—Hakon Ahlberg.** Chief Architect to Royal Medical Board of Sweden, 1934– . Professor of Ornamental Architecture, Royal Technical College, Stockholm University, 1918–29. Author of *Modern Swedish Architecture.*

**H. A. H.—Howard Archibald Hubbard.** Professor of History and Head of the Dept. of History and Political Science, University of Arizona, Tucson, Ariz.

**H. A. Ha.—H. Ainsworth Harrison.** Research Chemist, Chemical Research Laboratory, Teddington, Middlesex, England

**H. A. He—Harold Augustus Hyde.** Keeper Department of Botany, National Museum of Wales, Cardiff, Wales. Author of *Welsh Timber Trees.* Co-author of *Welsh Ferns; Welsh Flowering Plants.*

**Ha. Hr.—Harry Hilfer.** Chemist, Lucien Lelong Inc, Chicago, Ill

**H. A. I.—Harold Adams Innis.** Former Professor and Head of the Department of Political Economy, University of Toronto, Toronto, Ont Author of *A History of the Canadian Pacific Railway;* etc.

**H. A. J.—Henry Albert Jones.** Principal Olericulturist, U S Department of Agriculture, Beltsville, Md. Co-author of *Truck Crop Plants;* etc.

**H. A. K.—Hans Adolf Krebs.** Professor of Biochemistry, University of Sheffield, Sheffield, Eng

**H. A. M.—Sir Henry Alexander Miers.** Trustee of the British Museum, London, 1926–39 Vice-Chancellor of the University of Manchester and Professor of Crystallography, 1915–26. Author of *A Visit to the Yukon Gold Fields;* etc.

**H. A. My.—Howard A. Murphy.** Professor of Music and Music Education, Teachers College, Columbia University, New York, N Y. Author of *Form in Music for the Listener; Teaching Musicianship;* co-author of *Creative Harmony and Musicianship*

**H. A. R.—Horace Arthur Rose.** District and Sessions Judge, Punjab, India, 1906–17.

**H. A. Re.—Harrison August Ruehe.** Professor of Dairy Manufactures, College of Agriculture and Chief of Dairy Manufactures, Illinois Agricultural Experimental Station, 1945–53. [illegible] factures and Head of the Department of Dairy Husbandry, University of Illinois, Urbana, Ill, 1921–45.

**H. A. R. G.—Sir Hamilton Alexander Rosskeen Gibb.** Laudian Professor of Arabic, Oxford University. Editor of *Whither Islam.* Author of *Arabic Literature; Damascus Chronicle of the Crusades; Modern Trends in Islam.*

**H. A. Rn.—Hobart Ansteth Reimann, M.D.** Professor of Medicine, Jefferson Medical College, Philadelphia, Pa Author of *The Pneumonias,* Editor of *Treatment in General Medicine.*

**H. Ar. Rn.—H. Archie Richardson.** Freelance sports writer and [illegible] research specialist Author of *The [illegible] Story;* etc.

**H. A. S.—H. A. Sloman.** Senior Principal Scientific Officer, Metallurgy Division, National Physical Laboratory, Teddington, Middlesex, England.

**H. A. Sc.—Hugh Arthur Scott.** For 25 years Music and Dramatic Critic of the *Westminster Gazette,* London.

**H. A. Sch.—Harry August Schoth.** Senior Agronomist, Division of Forage Crops and Diseases, Bureau of Plant Industry, Soils, and Agricultural Engineering, U S. Department of Agriculture, Oregon State College, Corvallis, Ore.

**Ha. Sh.—Haig Shekerjian.** Brigadier General. Commanding General, Chemical Warfare Replacement Training Center, 1942–43; Commanding General, Camp Sibert, Ala., 1943–44.

**H. A. T.—Howard A. Turner.** Assistant Agricultural Economist, U.S. Department of Agriculture.

**Ha. W.—Harvey Walker.** Professor of Political Science, Ohio State University, Columbus, O Author of *Public Administration in the United States.*

**H. A. Wf.—Heinrich A. Wieschhoff.** Curator, African Section, University of Pennsylvania Museum, Lecturer on African Culture Graduate School, University of Pennsylvania, Philadelphia, Pa Author of *Colonial Policies in Africa;* etc.

**H. Ba.—Hugh Baillie.** President and General Manager, United Press Associations, New York, N Y

**H. B. B.—Sir Henry Britten Brackenbury, M.D.** Former Vice-President of the Council of the British Medical Association.

**H. B. C.—H. B. Carter.** Secretary, Reuters Limited.

**H. B. Cs.—Henry B. Collins.** Anthropologist. Bureau of American Ethnology, Smithsonian Institution, Washington, D C. Author of *Archaeology of St. Lawrence Island, Alaska; Outline of Eskimo Prehistory; Prehistoric Art of the Alaskan Eskimo.*

**H. B. D.—Harold Baily Dixon** Chairman of the Royal Technical College, Salford, England, 1916–30. Honorary Professor of Chemistry, University of Manchester, 1922. Author of *The Velocity of Sound in Gases and Vapours.* etc.

**H. Be.—Horace Beck.** Specialist on beads; arranged the Egyptian beads in the British Museum, London. Author of *The Classification and Nomenclature of Beads and Pendants,* etc.

**H. B. H.—Henry Beetle Hough.** Editor and Publisher, *Vineyard Gazette,* Edgartown, Martha's Vineyard, Mass Co-author of Pulitzer prize-winning *History of Services Rendered by the Associated Press.* Author of *Martha's Vineyard Summer Resort; Country Editor;* etc.

**H. B. Hd.—Herbert B. Hungerford.** Head, Department of Entomology and State Entomologist, University of Kansas, Lawrence, Kan.

**H. B. Hs.—Henry Bohn Hass.** Head of the Department of Chemistry, Purdue University, Lafayette, Ind.

**H. Bi.—Henri Bidou.** Former Editor of *Le Journal des Débats,* Paris

**H. B. Lm.—Harvey Brace Lemon.** Professor of Physics, The University of Chicago, and Curator of Physical Science, Museum of Science and Industry, Chicago, Ill Author of *From Galileo to Cosmic Rays;* etc.

**H. B. Md.—Herbert B. Mulford.** Former banker and newspaperman

**H. Bn.—Harry Bateman.** Professor of Mathematics, Theoretical Physics and Aeronautics, California Institute of Technology, Pasadena, 1917–46. Author of *Partial Differential Equations of Mathematical Physics; Electrical and Optical Wave Motion; Differential Equations.*

**H. Bp.—Rev. Herbert Louis Bishop.** Missionary, Lourenço Marques, Mozambique, Portuguese East Africa, 1909–26.

**H. Br.—Henry Bradley.** Former Co-editor of *The New English Dictionary* (Oxford). President, Philological Society, 1891–93, 1900–03 and 1909–10 President, Oxford Philological Society, 1921. Author of *The Story of the Goths; The Making of English;* etc.

**H. B. R.—Harold B. Rowe.** Member of Research Staff, Brookings Institution, Washington, D C., 1933– Former Director, Food Rationing Division, Office of Price Administration.

**H. Bt.—Harry Barnhart.** U S singer Former leader of community singing.

**H. B. T.—Harold Bradford Tukey.** Head, Department of Horticulture, Michigan State College, East Lansing, Mich Chief in Research, New York State Agricultural Experimental Station and Professor of Pomology, Cornell University, 1927–45 Editor, *Proceedings of the American Society for Horticultural Science.*

**H. B. We.—Harry Brandeis Wehle.** Curator of Paintings, Metropolitan Museum of Art, New York, N Y

**H. C.—Hugh Chisholm.** Editor of the eleventh and twelfth editions of the *Encyclopædia Britannica*

**H. Ca.—Helen M. Cam.** Professor of History, Harvard University and Radcliffe College, Cambridge, Mass, 1948– Lecturer in History, Cambridge University, 1928–48 Author of *Studies in the Hundred Rolls.*

**H. C. Bo.—H. C. Booth.** Consulting Engineer, Messrs Booth, Wilson and Pettit, London.

**H. C. Br.—Harold Chalton Bradshaw.** Former Secretary, Royal Fine Art Commission

**H. C. C—Henry Cope Colles.** Musical Critic of *The Times,* London, 1911–43. Editor of third edition, Grove's *Dictionary of Music and Musicians,* 1927, fourth edition, 1940.

**H. C. D.—Harold Collett Dent.** Editor of *The Times Educational Supplement*, London

**H. C. Dn.—Hobart Cutler Dickinson.** Former Chief, Heat and Power Division, National Bureau of Standards, Washington, D C.

**H. C. Dy.—Henry Clifford Darby.** John Rankin Professor of Geography, University of Liverpool [illegible] Ehrman Fellow, King's College, Cambridge, 1932–45. Author of *The [illegible]*; etc.

**H. Ch.—H. Chambers.** Former Principal, Ministry of Agriculture and Fisheries, London.

**H. Cha.—Henry Chalmers.** Adviser on Commercial Policy, U S. Department of Commerce, Washington, D C. Author of *World Trade Policies: the Changing Panorama, 1920–53;* etc.

**H. C. Hk.—Harold C. Hickock.** Assistant Sales Manager, Elevator Division, Westinghouse Electric Corporation, Jersey City, N.J Author of *The Economics of Vertical Transportation.*

**H. C. Hr.—Hubert Crouse Heffner.** Professor of Dramatic Literature and Executive Head of the Department of Speech and Drama, Stanford University, Stanford, Calif. Co-author of *Modern Theatre Practice.*

**H. C. Hy.—Rev. Horace Carter Hovey, D.D.** Author of *Handbook of Mammoth Cave of Kentucky;* etc

**H. C. J. H.—Sir (Henry Cecil) John Hunt.** Brigadier Assistant Commandant, Staff College. Camberley, Surrey, Eng. Leader of the Mount Everest Expedition, 1953. Author of *The Ascent of Everest.*

**H. Cl.—Sir Hugh Clifford.** Former Governor of the Straits Settlements. High Commissioner for the Malay States and British Agent for Borneo 1927–29 Governor of Ceylon, 1925–27 Author, *Further India;* etc.

**H. C. L.—H. C. Long.** Former Senior Staff Officer, Ministry of Agriculture and Fisheries, London Editor of *Journal of Ministry of Agriculture and Fisheries.* Author of *Common Weeds of the Farm and Garden; Plants Poisonous to Livestock;* etc.

**H. C. M. C.—H. C. M. Case.** Head, Department of Agricultural Economics, College of Agriculture, University of Illinois, Urbana.

**H. C. Pr.—Horace Chamberlain Porter.** Consulting chemist and chemical engineer, Philadelphia, Pa Author of *Coal Carbonization;* etc.

**H. C. R.—Henry Cushier Raven.** Former Curator, Department of Comparative Anatomy, American Museum of Natural History, New York, N Y. Prosector, N.Y. Zoological Society, 1925–27. Associate, Vertebrate Palaeontology, Columbia University, 1926–29.

**H. C. Ro.—H. C. Robbins.** Former General Manager, Press Association.

**H. C. S.—H. C. Stuart.** Former Assistant Collector, U S. Custom Service, New York, N.Y.

**H. C. T.—Harry C. Thomson.** Chief Historian, U.S. Army Ordnance Corps, Washington, D.C.

**H. C. U.—Harold Clayton Urey.** Martin A. Ryerson Distinguished Service Professor of Chemistry, The University of Chicago. Nobel Prize for the discovery of deuterium (heavy hydrogen), 1934.

**H. C. V.—Hein Cornelis Visser.** Barrister.

**H. C[illegible] Henry Crew.** Former Professor of [illegible] University, Evanston, Ill. Author of *General Physics; Rise of Modern Physics*

**H. C. W.—Henry C. Watts.** Fellow of the Royal Aeronautical Society, England Author of *Screw Propellers for Aircraft.*

**H. C. Wt.—Hurd Curtis Willett.** Professor of Meteorology, Massachusetts Institute of Technology, Cambridge, Mass Author of *Descriptive Meteorology*

**H. Cx.—Henri Cochaux.** Advocate of the Court of Appeal, Brussels, Belg Author of *Le Pape et l'Italie*

**H. Cy.—Harold Conolly.** County Architect, County Council of Essex, Eng.

**H. D.—Herbert Dingle.** Professor of History and Philosophy of Science, University College, University of London Director of the South Kensington Observatory. Author of *Modern Astrophysics;* etc.

**H. Da.—H. Das.** Graduate Member of New College, Oxford. Editor of *The Life and Letters of Toru Dutt.*

**H. D. A. M.—Rev. Henry Dewsbury Alves Major, D.D.** Honorary Canon of Birmingham, England Examining Chaplain to the Bishop of Birmingham Editor of the *Modern Churchman.* Author of *English Modernism;* etc.

**Hd. B.—Harold Briercliffe.** Editor, *Motor Cycle and Cycle Trader.*

**Hd. C.—Howard F. Cline.** Director, The Hispanic Foundation, Library of Congress, Washington, D.C.

**H. D. C.—Harold Dean Cater.** Director, Minnesota Historical Society. Author of *Henry Adams and His Friends;* etc

**H. De.—Rev. Hippolyte Delehaye, S.J.** Former Co-editor of the *Acta Sanctorum.* Author of *The Work of the Bollandists.*

**H. D. K.—Harry Dexter Kitson.** Professor of Education, Teachers College, Columbia University. Author of *The Psychology of Vocational Adjustment;* etc Editor, "Kitson Careers" Series, *Occupations—the Vocational Guidance Journal.*

**H. D. L.—Harold D. Lasswell.** Professor of Law, Yale University School of Law, New Haven, Conn Author of *World Politics and Personal Insecurity;* etc.

**H. D. N.—Henry Darnley Naylor.** Former Professor of Classics in the University of Adelaide, South Australia. Former Governor of the Public Library of South Australia.

**H. D. O.—Hilda Diana Oakeley.** Head of Department of Philosophy, King's College, University of London, 1930–31. Author of *A Study in the Philosophy of Personality; History and the Self;* etc.

**H. Ds.—Hallowell Davis, M.D.** Director of Research, Central Institute for the Deaf, St. Louis, Mo Author of *Hearing and Deafness. a Guide for Laymen.* Co-author of *Hearing Aids; Hearing: Its Psychology and Physiology.*

**H. D. S.—Harlow Dow Savage.** Former President of Dry Quenching Equipment Corporation, New York, N Y.

**H. D. Sm.—Hermon Dunlap Smith.** Vice-President, Marsh and McLennan, Chicago. Author of *Revolutionary War Journals of Henry Dearborn, 1773–83,* with biographical essay.

**H. D. T.—Harvey Doria Turing.** Editor of *The Salmon and Trout Magazine,* 1933– . Author of *Trout Fishing, Modern Coarse Fishing,* etc.

**H. E.—Haven Emerson, M.D.** Professor of Public Health Administration, Columbia University, 1922–40. Editor of *Alcohol and Man;* etc.

**H. E. Ag.—Hugh Elmer Agnew.** Chairman of the Department of Marketing, New York University School of Commerce, Accounts and Finance, 1928–43 Author of *Co-operative Advertising by Competitors,* [illegible] etc.

**H. E. Ba.—Harry Everett Barnard.** Former President, H E Barnard, Inc, Indianapolis, Ind Editor of *Baking Technology*

**H. E. Bar.—Harry Elmer Barnes.** Professor of History and Sociology, Smith College, Northampton, Mass, 1923–30. Author of *Progress of American Penology; The Repression of Crime;* etc

**H. E. Bl.—Sir Herbert Edward Blumberg.** General. Former Honorary Colonel Commandant, Chatham Division, Royal Marines.

**H. E. Bu.—Harold Ernest Burtt.** Professor of Psychology, Ohio State University, Columbus, O. Author of *Legal Psychology; Psychology in Advertising.*

**H. E. By.—Huly Edwin Bray.** Former Director, Office of Information, War Assets Administration, Washington, D C,

**H. E. C.—H. E. Cox.** Public Analyst for the Metropolitan Borough of Hampstead, London

**H. E. D.—Harold Edward Dale.** Principal Assistant Secretary, Ministry of Agriculture and Fisheries, 1927–35.

**H. E. Da.—H. E. Dalton.** Former Comptroller, Studebaker Corporation, South Bend, Ind.

**H. E. Du.—Henry Ernest Dudeney.** Mathematical puzzle expert Author of *The Canterbury Puzzles; Amusements in Mathematics;* etc

**H. E. E.—H. E. Ewing.** Entomologist. Bureau of Entomology and Plant Quarantine, U S. Department of Agriculture, Washington, D C, 1929–45 Author of *Manual of External Parasites.*

**H. E. Ex.—Hiram Eli Essex.** Co-chairman, Department of Physiology, Mayo Foundation and Mayo Clinic, Rochester, Minn

**H. E. G.—Henry Edward Garrett.** Professor and Head of the Department of Psychology. Columbia University. Author of *Great Experiments in Psychology;* etc.

**H. E. Hd.—Herman Eliot Hayward.** Senior Plant Anatomist, Bureau of Plant Industry, Soils, and Agricultural Engineering, U.S. Department of Agriculture Author of *The Structure of Economic Plants.*

**H. S. Dl.—Harold S(heely) Diehl, M.D.** Dean of the Medical Sciences and Professor of Public Health, University of Minnesota, Minneapolis, Minn Author of *Healthful Living; A Textbook of Healthful Living.*

**H. S. Dt.—Harriet S. Daggett.** Professor of Law, Law School, Louisiana State University, Baton Rouge, La Author of *Community Property System of Louisiana; Mineral Rights in Louisiana.*

**H. S. Dy.—Howard S. Dewey.** Office of Public Information, Commander of Submarine Force, U S Atlantic Fleet.

**H. S. F.—Herbert Sinclair Fairbank.** Deputy Commissioner, Research, Public Roads Administration, Federal Works Agency, Washington, D C. Editor, *Public Roads,* 1920–27.

**H. Sg.—Haakon Shetelig.** Emeritus Professor, University of Bergen, Bergen, Nor. Author of *Préhistoire de la Norvège; Scandinavian Archaeology.*

**Hs. H.—Hans Huth.** Research Curator, Art Institute of Chicago, Chicago, Ill. Author of *Abraham und David Roentgen und ihre Neuwieder Moebelwerkstatt; Kuenstler Werkstatt der Spaetgothik; Observations Concerning the Conservation of Monuments in Europe and America; Der Park von Sanssouci.*

**H. Sh.—Herman Shaw.** Director and Secretary, London Science Museum, 1945–50; former Keeper, Department of Physics and Geophysics Author of *Applied Geophysics: A Brief Survey of the Development of Apparatus and Methods Employed in the Investigation of Subterranean Structural Conditions and the Location of Mineral Deposits.*

**H. S. H.—H. S. Harrison.** Former Curator, The Horniman Museum, London.

**H. S. Hd.—Herbert Spencer Harned.** Professor of Chemistry, Yale University, New Haven, Conn. Author of *The Physical Chemistry of Electrolytic Solutions.*

**H. S. H.-S.—Henry Selby Hele-Shaw.** Former Professor of Engineering, University of Liverpool, England.

**H. Si.—Henry Sidgwick.** Knightbridge Professor of Moral Philosophy, Cambridge University, 1883–1900. Author of *Outlines of the History of Ethics; Lectures on the Ethics.*

**H. Sim.—Harry Simons.** Former Technical Editor of *The Clothing Trade Journal,* New York, N.Y.

**H. S.-J.—Sir Henry Stuart-Jones.** Principal of University College of Wales, Aberystwyth, 1927–34. Vice-Chancellor of the University of Wales, 1929–31. Former Camden Prof. of Ancient History, Oxford University.

**H. S. Js.—Sir Harold Spencer Jones.** Astronomer Royal, 1933– . President, British Horological Institute, 1939– . Author of *General Astronomy; Worlds Without End; Life on Other Worlds.*

**H. S. K.—H. S. Kingsford.** Former Assistant Secretary of the Society of Antiquaries, London

**H. S. Kn.—Hugh S. Knowles.** President and Director of Research, Industrial Research Products, Inc., Franklin Park, Ill.

**H. Sl.—Henri Speciael.** Managing Director, Société Internationale d'Énergie Hydro-électrique.

**H. S. L.—Herbert Sidney Langfeld.** Stuart Professor of Psychology and Director of Psychology Laboratory, Princeton University. Author of *The Aesthetic Attitude;* etc.

**H. Sle.—Sir Henry Slesser.** Member of Devon County Council Lord Justice of Appeal, 1929–40. Author of *The Middle Ages in the West;* etc.

**H. Sm.—Herbert Sidebotham.** Formerly on editorial staff of *The Manchester Guardian,* Manchester, England. Author of *Pillars of the State;* etc.

**H. S. M. C.—Harold Scott Macdonald Coxeter.** Professor of Mathematics, University of Toronto, Toronto, Ont. Author of *The Real Projective Plane; Regular Polytopes.*

**H. Sn.—Heinrich Straumann.** Professor of English Literature, University of Zürich, Zurich, Switz.

**H. Sp.—Howard Spence.** Managing Director, Peter Spence and Sons, Ltd., Manchester Alum Works.

**H. S. P.—H. S. Pearson.** Senior Assistant, Department of Zoology, University College, University of London.

**H. Spe.—E. Harold Spender.** Author of *A Briton in America; The Cauldron of Europe;* and biographies of *David Lloyd George;* etc.

**H. Spr.—Harold Sprout.** Professor of Politics in Princeton University. Co-author, with Margaret Tuttle Sprout, of *The Rise of American Naval Power, 1776–1918; Toward a New Order of Sea Power: American Naval Policy and the World Scene, 1918–1922;* etc.

**H. S. Sh.—Harry S. Smith.** Professor of Entomology, University of California, and Entomologist in the Agricultural Experiment Station, Riverside, Calif.

**H. St.—Henry Sturt.** Author of *Idola Theatri; The Idea of a Free Church; Personal Idealism.*

**H. St. J. B. P.—Harry St. John Bridger Philby.** Explorer in Arabia. Author of *The Heart of Arabia;* etc.

**H. St. J. I.—Henry St. John Ingram.** Editor of *Contract Bridge Journal.* Author of *How to Win at Bridge; The Ingram One Club.*

**H. St. J. W.—Harold St. John Loyd Winterbotham.** Brigadier, formerly with the Royal Engineers Former General Secretary, International Geodetic and Geophysical Union Author of *Ordnance Survey; A Key to Maps;* etc.

**H. S. V.—Harry Shultz Vandiver.** Professor of Pure Mathematics, University of Texas, Austin, Tex.

**H. S. Vd.—Henry Serrano Villard.** Deputy Director, Office of Near Eastern and African Affairs, U.S. Department of State, Washington, D C, 1946–47. Chief, Division of African Affairs, 1944–46.

**H. Sw.—Henry Sweet.** Author of *A History of English Sounds since the Earliest Period;* etc.

**H. S. W.—Henry Seely White.** Former Professor of Mathematics, Vassar College, Poughkeepsie, N.Y. Author of *Plane Curves of the Third Order.*

**H. S. Wl.—Hubert Stanley Wall.** Professor of Mathematics, University of Texas, Austin, Tex Author of *Analytic Theory of Continued Fractions.*

**H. T.—Henry Tetlow.** Henry Tetlow Company Ltd., London.

**H. T. A.—Herbert Thomas Andrews.** Author of "The Commentary on Acts" in the *Westminster New Testament;* "The Apocryphal Books of the Old and New Testament," *Century Bible Handbooks.*

**H. T. B.—Henry T. Bailey.** Painter and illustrator Former Director the Cleveland School of Art and the Carl Huntington Polytechnic Institute. Author of *Art Education;* etc

**H. T. Be.—Herman Thompson Briscoe.** Professor of Chemistry, Vice-President and Dean of the Faculties, Indiana University, Bloomington, Ind. Author of *General Chemistry for Colleges; Structure and Properties of Matter.*

**H. T. D.—Harold Thayer Davis.** Henry S. Noyes Professor of Mathematics and Chairman, Department of Mathematics, Northwestern University, Evanston, Ill. Author of *The Theory of Linear Operators;* etc.

**H. Te.—Henry Taube.** Associate Professor of Chemistry, The University of Chicago.

**H. T. Es.—Harry Taylor Edwards.** Senior Technologist, Bureau of Plant Industry, Soils, and Agricultural Engineering, U S. Department of Agriculture, Washington, D.C., 1924–45.

**Ht. F.—Herbert Filer.** Partner of Filer, Schmidt & Co., New York, N.Y. Dealer in put and call options.

**H. T. F.—Howard T. Francis.** Supervisor Electrochemistry Research, Metals Research Department, Armour Research Foundation, Illinois Institute of Technology, Chicago, Ill.

**H. Th.—Huston Thompson.** Former Chairman of Federal Trade Commission. Assistant Attorney General of United States, 1913–18 Author of *Co-Operative Marketing Abroad;* etc.

**H. T. H.—Horace Terhune Herrick.** Special Assistant to the Chief. Bureau of Agricultural and Industrial Chemistry, U.S Department of Agriculture, Washington, D.C.

**H. Tho.—Sir Henry Thomas.** Former Principal Keeper of Printed Books in the British Museum, London.

**H. T. M.—Hudson T. Morton.** Standards Engineer, the Fafnir Bearing Company, New Britain, Conn. Author of *Textbook of Anti-Friction Bearings.*

**H. T. Mg.—Helen Taft Manning.** Professor of History, Bryn Mawr College, Bryn Mawr, Pa. Author of *British Colonial Government After the American Revolution.*

**H. To.—Henry Tonks.** Former Professor of Fine Art in the University of London.

**H. T. S.—Hugh Tempest Sheringham.** Former Assistant Editor of *The Field.* Author of *Elements of Angling; Coarse Fishing; Trout Fishing;* etc.

**H. T. T.—Sir Henry Thomas Tizard.** President of Magdalen College, Oxford, 1942–46.

**Ht. W.—Hubert Walker.** Manager, M. F. A. Sales Engineering Department, American-LaFrance-Foamite Corporation, Elmira, N.Y.

**Hu. De.—Hubert Deschamps.** Former French colonial governor Professor at the École de la France d'Outremer and the Institut d'Études Politiques, University of Paris. Author of *Champlain; Madagascar; L'Union française;* etc.

**Hu. S.—Hugh Shearman.** Author of *Anglo-Irish Relations; Finland; Modern Ireland; Not an Inch, a Study of Northern Ireland; Ulster.*

**H. U. S.—Harald Ulrik Sverdrup.** Professor of Oceanography, University of California, and Director, Scripps Institution of Oceanography, La Jolla, Calif. Author of *Oceanography for Meteorologists.* Co-author of *The Oceans; Their Physics, Chemistry, and General Biology.*

**H. Van D.—Henry Van Dyke, D.D.** Professor of English Literature, 1900–23, Princeton University. Author of *The Spirit of America;* etc.

**H. V. B. K.—Hibberd Van Buren Kline, Jr.** Assistant Professor of Geography, Syracuse University, Syracuse, N Y.

**H. V. L.—Harold Victor Livermore.** Educational Director, Hispanic and Luso-Brazilian Council, London. Author of *A History of Portugal.*

**H. V. T.—Harold Victor Taylor.** Senior Educational and Advisory Officer, Ministry of Agriculture and Fisheries, London. Author of *The Apples of England*

**H. W. A.—Heinz Wolfgang Arndt.** Professor of Economics, Canberra University College, Canberra, Austr. Author of *The Economic Lessons of the Nineteen-Thirties.*

**H. W. B.—H. W. Bartleet.** Writer on motoring and cycling topics.

**H. W. Bea.—Henry Walter Bearce.** Chief, Division of Weights and Measures, Bureau of Standards, Washington, D.C., 1910–45 Author of *A Fundamental Basis for ... of Length;* etc.

**H. W. B. J.—Horace W. B. Joseph.** Lecturer in Philosophy, Oxford University, 1927–32.

**H. W. Bl.—Herbert William Blunt.** Student, Tutor and Librarian, Christ Church, Oxford.

**H. W. Bn.—Henry W. Brosin, M.D.** Professor of Psychiatry, University of Pittsburgh, Pittsburgh, Pa

**H. W. C.—Harvey Wiley Corbett.** Former Lecturer in Architecture, Columbia University

**H. W. C. Br.—Harris Warren C. Browne.** Editor and publisher, *The National Lithographer,* New York, N Y.

**H. W. C. D.—Henry William Carless Davis.** Former Director, *Dictionary of National Biography* Former Regius Professor of Modern History and Fellow and Tutor of Balliol College, Oxford Fellow of All Souls, Oxford, 1895–1902

**H. Wd.—Hubert Witheford.** Research Assistant. War History Branch, New Zealand Department of Internal Affairs, Wellington, N Z Author of *The Falcon Mask; Shadow of the Flames.*

**H. W. F.—Sir Howard Walter Florey.** Professor of Pathology, Oxford University. Nobel Prize for Medicine and Physiology, 1945

**H. W. G.—H. W. Griffin.** Superintending Clerk, Board of Trade. First Counsel. Secretary, National Maritime Board.

**H. W. Ga.—Heathcote William Garrod.** Former Professor of Poetry, Oxford University. Author of *Wordsworth: Lectures and Essays; The Profession of Poetry; Byron;* etc.

**H. W. Gn.—Howard Wright Gordon, Jr.** Lieutenant Commander, U.S. Navy, Public Relations Branch.

**H. W. H.—Hope W. Hogg.** Former Professor of Semitic Languages and Literatures in the University of Manchester, England.

**H. W. Hk.—Howard W. Hopkirk.** Senior Consultant, Child Welfare League of America Author of *Institutions Serving Children.*

**H. W. H. K.—Henry William Howard Knott.** Former Lecturer at the Law School of the University of Manitoba, Winnipeg, Canada.

**H. Wit.—Hartley Withers.** Editor of *The Economist,* London, 1916–21 Director of Financial Enquiries in the Treasury, 1915–16. Author of *Money; International Finance;* etc.

**H. W. K.—Henry Wilder Keyes.** U S Senator, 1919–37. Governor of New Hampshire, 1917–19.

**H. W. L. E.—Herbert Walter Lloyd Evans.** Former Superintendent of the Royal Mint (retired, 1939).

**H. W. M.—Horace Winchell Magoun.** Professor of Anatomy, School of Medicine, University of California, Los Angeles, Calif.

**H. Wn.—Walter Hugh John Wilkinson.** Former British Envoy at the Court of Nepal, India.

**H. Wo.—Humbert Wolfe.** Poet. Author of *London Sonnets; Cursory Rhymes; Humoresque;* etc.

**H. W. P.—H. W. Parker.** Keeper of Zoology, British Museum (Natural History), London.

**H. W. Ph.—Henry Willis Phelps.** Former Chairman of the Board of Directors, American Can Company.

**H. Wr.—Harry Wexler.** Chief, Division of Special Scientific Services, Weather Bureau, U.S. Department of Commerce, Washington, D.C.

**H. W. R.—Rev. Henry Wheeler Robinson, Hon. D.D.** Principal of Regent's Park College, Oxford, 1920–42. Author of *The Religious Ideas of the Old Testament;* etc.

**H. Ws.—Howel Williams.** Chairman, Department of Geological Sciences, University of California, Berkeley, Calif. Author of *Crater Lake: The Story of Its Origin;* co-author of *Methods in Geological Surveying*

**H. W. S.—Henry Wickham Steed.** Lecturer on Central European History, King's College, University of London, 1925–38. Proprietor and Editor of *The Review of Reviews,* 1923–30 Editor of *The Times,* London, 1919–22 Author of *The Antecedents of Post-War Europe;* etc.

**H. W. Sh.—Homer W. Smith.** Professor of Physiology, New York University College of Medicine, New York, N Y. Author of *The Kidney—Structure and Function in Health and Disease.*

**H. W. Sr.**—**Herbert Wallace Schneider.** Professor of Philosophy, Columbia University, New York, N.Y. Author of *Making the Fascist State; The Fascist Government of Italy; The Puritan Mind.*

**H. W. Ss.**—**Henry W. Sams.** Associate Professor of English and Director of the Summer Quarter, The University of Chicago Author of *Problems in Reading and Writing.*

**H. W. W.**—**Herbert Wrigley Wilson.** Former Assistant Editor of *The Daily Mail* and Director of Associated Newspapers, Ltd. Author of *Ironclad, in Action;* etc.

**H. W. Ws.**—**Harry Warren Wells.** Physicist and Radio Engineer, Ionospheric Section, Department of Terrestrial Magnetism, Carnegie Institution of Washington, D C.

**H. W. W. Wil.**—**Sir Herbert William W. Wilberforce.** Deputy Chairman of the County of London Sessions, 1926–38. Metropolitan Police Magistrate, 1914–26.

**H. Y.**—**Sir Henry Yule.** British Orientalist. Author of *Cathay and the Way Thither; The Book of Ser Marco Polo.*

**I. A.**—**Israel Abrahams.** Former Reader in Talmudic and Rabbinic Literature in Cambridge University. Author of *A Short History of Jewish Literature;* etc.

**I. A. R.**—**Irma A. Richter.** Artist and writer.

**I. B.**—**Irving Brown.** Former Assistant Professor of Romance Languages, Columbia University. Author of *Nights and Days on the Gypsy Trail; Gypsy Fires in America.*

**I. B. B.**—**Sir Isaac Bayley Balfour, M.D.** Former King's Botanist in Scotland, Regius Keeper of Royal Botanic Garden, Edinburgh, and Professor of Botany in the University of Edinburgh, Scot.

**I. B. C.**—**I. Bernard Cohen.** Instructor in Physics, Harvard University, 1941– . Author of *Benjamin Franklin's Experiments;* etc.

**I. B. J.**—**Iral Brown Johns.** Assistant Central Research Director, Monsanto Chemical Company, Dayton, O. Author of *Laboratory Manual of Microchemistry.*

**I. B. K.**—**Irving B. Kravis.** Assistant Professor of Economics, Wharton School of Finance and Commerce, University of Pennsylvania, Philadelphia, Pa.

**I. Br.**—**Ivor Brown.** Editor of *The Observer.* Director of Drama, Council for Encouragement of Music and the Arts, 1940–42. Shute Lecturer in the Art of the Theatre, Liverpool University, Liverpool, England, 1926. Author of *Now on View;* etc.

**I. C. R.**—**Isidor Clinton Rubin, M.D.** Consulting Gynaecologist; Mount Sinai, Montefiore, Beth Israel and Harlem Hospitals, New York, N.Y. Author of *Symptoms in Gynaecology.*

**I. D.**—**Isaac Deutscher.** Author of *Soviet Trade Unions; Stalin: A Political Biography.*

**I. D. A.**—**Ira D. Anderson.** Professor of Marketing and Chairman of the Marketing Department, Northwestern University School of Commerce, Evanston, Ill. Author of *Principles of Retailing.*

**I. Dd.**—**Irving Dilliard.** Editor of the Editorial Page, *St. Louis Post-Dispatch* Author of *I'm From Missouri.* Editor of *Mr. Justice Brandeis: Great American; The Spirit of Liberty: Addresses and Papers of Learned Hand.*

**I. D. E.**—**Ivo D'Oyly Elliott.** Indian Civil Service (retired). Editor of *Balliol College Register.*

**I. E.**—**Isidore Epstein.** Principal, Jews' College, London. Author of *Jewish Way of Life; Judaism.* Editor of *Babylonian Talmud in English.*

**I. E. L.**—**Isabel Ely Lord.** Editor and consultant. Author of *Getting Your Money's Worth;* Editor of *Everybody's Cookbook.*

**I. E. M.**—**Irving E. Muskat.** Director of Research, Vulcan Detinning Company, Sewaren, N.J.

**I. F. D. M.**—**Ian F. D. Morrow.** Former Senior Moderator, Trinity College, Dublin.

**I. F. H.**—**Irving F. Hand.** In Charge, U.S. Weather Bureau Solar Radiations Investigations, Blue Hill Observatory, Milton, Mass.

**I. F. Hn.**—**I. Forest Huddleson.** Research Professor, Michigan State College, East Lansing, Mich. Author of *Brucellosis in Man and Animals*

**I. Fr.**—**Sir Ian Fraser.** Chairman of the Executive Council, St. Dunstan's (1921– ). Member of the Executive Council, National Institute for the Blind. Governor, British Broadcasting Corporation (1941–46). Author of *Whereas I Was Blind.*

**I. F. S.**—**Isabelle Florence Story.** Former Chief of Information, National Park Service, U.S. Department of the Interior.

**I. Fx.**—**Irving Fox.** Assistant Professor of Entomology, School of Tropical Medicine, University of Puerto Rico, San Juan, P.R., and Columbia University. Author of *The Fleas of Eastern United States;* etc.

**I. G.**—**Sir Israel Gollancz.** Former Fellow and Secretary of the British Academy. Former Professor of English Language and Literature in the University of London.

**I. Gg.**—**Isaac Gregg.** Director of Press Relations, Office of the Postmaster General, Washington, D.C.

**I. Gh.**—**Isidore Gersh.** Professor of Anatomy, The University of Chicago.

**I. Gy.**—**Ian Grey.** Secretary to the Council, Royal Institute of International Affairs, London.

**I. H.**—**Isaac Husik.** Former Professor of Philosophy, University of Pennsylvania, Philadelphia Pa Author of *A History of Mediaeval Jewish Philosophy;* etc.

**I. H. C.**—**Irving H. Crowne.** Chief Engineer, Splitdorf-Bethlehem Electric Company, Newark, N.J. Author of *Theory of A.C. Circuits.*

**I. H. F.**—**Irvin H. Fullmer.** Senior Physicist, National Bureau of Standards, U.S. Department of Commerce, Washington, D.C.

**I. H. H.**—**Ida Husted Harper.** Author, *Life and Work of Susan B. Anthony.* Co-author, *History of Women's Suffrage.*

**I. Hk.**—**Ives Hendrick, M.D.** Instructor, Harvard Medical School, Cambridge, Mass. Author of *Facts and Theories of Psychoanalysis; Practitioner System of Medicine; Psychoanalysis.*

**I. H. L.**—**Isaac H. Levin.** Technical Director, Gas Industries Company, Pittsburgh, Pa. Honorary member, Gas Products Association.

**I. J. C.**—**Isaac Joslin Cox.** Emeritus Professor of History, Northwestern University, Evanston, Ill. Author of *Nicaragua and the United States;* etc.

**I. J.-Ce.**—**Irène Joliot-Curie.** Professor of General Physics and Radioactivity, University of Paris, France. Director of the Curie Laboratory. Commissioner for Atomic Energy. Co-winner of the Nobel Prize for Chemistry, 1935. Author of *Les Radioéléments naturels;* etc.

**I. J. Ct.**—**Ira Judson Condit.** Associate Professor of Subtropical Horticulture, University of California and Associate Subtropical Horticulturist, Citrus Experiment Station, Riverside, Calif.

**I. J. F.**—**Iler J. Fairchild.** Secretary, Enameled Cast Iron Plumbing Fixtures Association and Vitreous China Plumbing Fixtures Association. Author of *The Grade Terminology Problem; Holding Power of Wood Screws.*

**I. J. T.**—**Irene Joan Thirsk.** Senior Research Fellow in Agrarian History, University College of Leicester, Leicester, Eng Author of *Fenland Farming in the Sixteenth Century*

**I. L. Bl.**—**Irene L. Blunt.** Secretary, The National Federation of Textiles, Inc., New York, N.Y.

**I. L. G.**—**Iva Lilian Giachardi.** Research Assistant, Foreign Office, London

**I. L. K.**—**Isaac Leon Kandel.** Emeritus Professor of Education, Teachers College, Columbia University. Author of *Elementary Education in England; Federal Aid for Vocational Education;* etc.

**I. McQ.**—**Irvine McQuarrie, M.D.** Professor and Head of the Department of Pediatrics, University of Minnesota, Minneapolis, Minn. Author of *The Experiments of Nature and Other Essays.*

**I. M. St.**—**I. M. Stainback.** Governor of Hawaii, 1942–51.

**I. N. G.**—**Ira Noel Gabrielson.** President, Wildlife Management Institute Former Director, Fish and Wildlife Service, U S Department of the Interior, Washington, D C Author of *Wildlife Conservation; Wildlife Refuges;* etc.

**I. R.**—**Irving Rappaport.** Director, the Long Island College Hospital, Brooklyn, N.Y.

**I. R. Wh.**—**Irma Lenore Reed White.** Free-lance writer.

**I. S.**—**Isaac Schapera.** Professor of Anthropology, London School of Economics and Political Science, University of London Author of *The Ethnic Composition of Tswana Tribes; Married Life in an African Tribe; Migrant Labour and Tribal Life; Native Land Tenure in the Bechuanaland Protectorate.*

**I. S. R.**—**I. S. Ravdin, M.D.** Director, Harrison Department of Surgical Research, and John Rhea Barton Professor of Surgery, School of Medicine, University of Pennsylvania, Philadelphia, Pa. Author of *American Edition of Kirschner's Operative Surgery.*

**I. S. S.**—**Ivan Stephan Sokolnikoff.** Professor of Mathematics, University of California, Los Angeles, Calif. Chief Technical Aide, Applied Mathematics Panel, National Defense Research Committee, Office of Scientific Research and Development 1944–45 Author of *Higher Mathematics for Engineers and Physicists; Advanced Calculus;* etc.

**I. W.**—**Sir Ifor Williams.** Emeritus Professor of Welsh, University of North Wales, Bangor, Wales. Author of *Canu Aneirin; Canu Llywarch Hen; Pedeir Keinc y Mabinogi.*

**I. W. S.**—**I. W. Shklovsky.** Author, *Literary Characteristics;* etc.

**J. A.**—**Rt. Hon. Sir John Anderson.** Chancellor of the Exchequer, 1943–45. Secretary, Ministry of Shipping, 1917–19. Permanent Undersecretary of State, Home Office, 1922–32. Governor of Bengal, 1932–37.

**J. A. An.**—**John Alan Appleman.** Attorney. Author of *Automobile Liability Insurance; Insurance Law and Practice;* etc.

J. Ab.—Jesse P. Abramson. Sports writer, *New York Herald Tribune*, New York, N.Y.

J. A. B.—James Alexander Beattie. Professor of Physical Chemistry, Massachusetts Institute of Technology, Cambridge, Mass., 1938– .

Ja. Br.—James Brewster. Connecticut State Librarian

J. A. Br.—James A. Baker, D.V.M. Director, Veterinary Virus Research Institute, Snyder Hill New York State Veterinary College, Cornell University, Ithaca, N.Y.

J. A. Bs.—John Arundel Barnes. Reader in Anthropology, London School of Economics, University of London. Author of *Marriage in a Changing Society; Politics in a Changing Society.*

J. A. Bw.—Joseph A. Bourdow. Assistant Editor, *Officer's Call*, Troop Information and Education Division, U.S. Department of the Army.

J. A. C.—Sir Joseph Archer Crowe. English consular officer and art critic Author (with Cavalcaselle) of *Early Flemish Painters;* etc

J. A. Ca.—John Anthony Carroll. Professor of Natural Philosophy, University of Aberdeen, Scotland, 1930–45 Assistant Director, Solar Physics Observatory, Lecturer in Astrophysics, Cambridge University, 1924–30.

Jac. F.—Jacob Fahrenfort. Financial Chief Editor, *Nieuwe Handelsblad*, Amsterdam. Now author of *Beurs en Krant, Geld en wat wij er mee doen.*

J. A. Co.—Jay Allen Cassino. Special Consultant on Public Relations to the Secretary, U.S. Department of the Army, and to the Chief of Staff, Washington, D.C.

J. A. Dn.—John A. Davison. Group Leader, General Laboratories, United States Rubber Company, Passaic, N.J.

J. A. E.—Sir (James) Alfred Ewing. Principal and Vice-Chancellor of Edinburgh University, Scotland, 1916–29. Professor of Mechanism and Applied Mechanics in Cambridge University, 1890–1903 President of the Royal Society of Edinburgh, 1924–29. Author of *Thermodynamics for Engineers; The Steam Engine and Other Heat Engines; Magnetic Induction in Iron and Other Metals;* etc.

J. A. Ed.—Sir John Augustine Edgell. Vice-Admiral, R.N. (retired). Admiralty Representative on the Port of London Authority Hydrographer of the Royal Navy, 1932–45.

J. A. Es.—Joseph Alvie Estes. Editor, *The Blood-Horse.* Research Director, American Thoroughbred Breeders Association Author of *American Race Horses; Average-Earnings Index (for Thoroughbred Sires).*

J. A. F.—Sir John Ambrose Fleming. Former consulting electrical engineer Professor in University College, University of London, 1885–1926. Author of *The Principles of Electric Wave Telegraphy and Telephony;* etc.

J. A. Fa.—James A(ugustine) Farrell. President of the United States Steel Corporation, New York, N.Y., 1911–32.

J. A. F.-M.—John Alexander Fuller-Maitland. Author of *Life of Robert Schumann; The Musician's Pilgrimage; Masters of German Music;* etc.

Ja. G. M.—James Grier Miller, M.D. Chairman and Professor, Department of Psychology, The University of Chicago, Chicago, Ill. Author of *Unconsciousness.*

Ja. H.—James Hillier. Research Physicist in charge of Electron Microscope Research, RCA Laboratories, Princeton, N.J.

J. A. H.—John Allen Howe. Former Assistant Director, Geological Survey, England. Author of *The Geology of Building Stones; Stones and Quarries;* etc.

Ja. Hn.—James Hogan. Professor of History, University College Cork. The Editor of *Analecta Hibernica* Author of *Election and Representation; Ireland in the European System;* etc. *The Irish Law of Kingship.*

J. A. Hn.—John Anthony Hutton. Research Assistant, Institute of Colonial Studies, Oxford University, 1946–48.

J. A. K.—Julius A. Krug. Secretary, U.S. Department of the Interior, Washington, D.C., 1946–49.

J. Al.—John Allan. Keeper, Department of Coins and Medals, British Museum, London, 1931–49 Vice-President, Royal Archaeological Institute.

J. A. Lo.—John Avery Lomax. Vice-President, Republic National Company, Dallas, Texas, 1925–32 President, American Folklore Society, 1912–13. Associate editor, *Southwest Review*, 1943– . Author of *Cowboy Songs;* etc.

J. A. M.—James Alexander Manson. Author of *The Bowler's Handbook;* etc.

J. A. Mi.—John A. Miller. Editor, Technical Publications, General Engineering Laboratory, General Electric Company, Schenectady, N.Y. Author of *Fares, Please!: Master Builders of 60 Centuries; Men and Volts at War; Workshop of Engineers.*

J. A. Mn.—J. Alden Mason. Curator, American Section, University Museum, University of Pennsylvania, Philadelphia, Pa.

J. A. P.—James Alexander Paterson, D.D. Former Professor of Hebrew and Old Testament Exegesis, New College, Edinburgh, Scot Author of *The Period of the Judges;* Translator of Schultz's *Old Testament Theology.*

J. A. Ph.—James Alexander Petch. Secretary to the Joint Matriculation Board of the Universities of Manchester, Liverpool, Leeds, Sheffield and Birmingham, Eng. Author of *Fifty Years of Examining: the Joint Matriculation Board, 1903 to 1953.*

J. A. R.—James Alexander Robertson. Archivist, Hall of Records, Annapolis, Md., 1935–39. Professor of American History, John B. Stetson University, De Land, Fla., 1923–33. Co-editor of Blair and Robertson's *The Philippine Islands.*

J. A. R. M.—Sir John Arthur Ransome Marriott. Honorary Fellow, former Fellow and Lecturer of Worcester College, Oxford Author of *The Remaking of Modern Europe;* etc.

J. A. Ry.—John Alfred Ryle, M.D. Professor of Social Medicine, Oxford University, 1943–50 Physician Extraordinary to the King. Regius Professor of Physic, Cambridge University, 1955–43

J. A. S.—John Addington Symonds. Author of *Renaissance in Italy;* etc.

J. A. Sc.—J. A. Scott, M.D. Deputy Medical Officer of Health and Deputy School Medical Officer, London County Council. London, Eng Author of *The National Health Service Act, 1946;* etc.

J. A. Sl.—Judith Ann Silburn. Former Trade Investigator, Ministry of Labour, London.

J. A. Sk.—Julian A. Steyermark. Curator of the Herbarium, Department of Botany, Chicago Natural History Museum, Chicago, Ill. Author of *Contributions to the Flora of Venezuela, Spring Flora of Missouri;* co-author of *Flora of Guatemala*

J. A. Sm.—John Alexander Smith. Former Professor of Moral and Metaphysical Philosophy, Oxford University.

J. A. Sp.—J. Alfred Spender. Editor of the *Westminster Gazette*, 1896–1922, author of *Fifty Years of Europe, A Short History of Our Times;* etc.

J. A. Sr.—Joseph Alois Schumpeter. Former Professor of Economics, Harvard University Author of *The Theory of Economic Development;* etc.

J. A. S. R.—John Anthony Sydney Ritson. Professor of Mining in the University of London at the Royal School of Mines, Imperial College, London.

J. A. St.—James Andrew Strahan. Former Professor of Jurisprudence, University of Belfast, Reader of Equity, Inns of Court, London, 1897–1929 Author of *The Bench and Bar of England;* etc

J. A. T.—John Aiton Todd. Special Officer (Jute), Government of Bengal, India. Author of *The Cotton World*

J. A. Th.—Sir John Arthur Thomson. Regius Professor of Natural History in the University of Aberdeen Scotland, 1899–1930. Gifford Lecturer, St Andrews, Scotland, 1915 Terry Lecturer, Yale University, 1924. Author of *The Study of Animal Life; Outlines of Zoology; Heredity;* etc.

J. A. To.—James Alner Tobey. Director of Nutrition, American Institute of Baking, 1937–43 Lecturer on public health law, Massachusetts Institute of Technology, Yale School of Medicine, Harvard School of Public Health, and Columbia University Associate editor of *American Journal of Public Health.* Author of *The National Government and Public Health.*

J. A. Tr.—James A. Tower. Professor of Geography, Birmingham-Southern College, Birmingham, Ala. Instructor, American University of Beirut, Lebanon, 1928–31.

J. Ay.—Joseph Anthony. Public relations consultant, journalist and editor

J. Ba.—Jean Babelon. Keeper, Department of Coins and Medals in the Bibliothèque Nationale, Paris, 1937– , Chief Editor of the *Gazette des Beaux-Arts*, 1928–39.

J. Bai.—Jacques Bainville. Former Editor of the monthly review, *Action Française.* Author of *Histoire de France;* etc.

J. Bar.—Sir Joseph Barcroft, M.D. Former Lecturer, King's College, Cambridge. Professor of Physiology, Cambridge University, 1926–37. Fullerian Professor of Physiology, Royal Institution, 1923–26 Former Director of Unit of Animal Physiology (Agricultural Research Council). Author of *The Respiratory Function of the Blood;* etc Editor of the sixth edition of Huxley's *Physiology* Co-editor of the *Cambridge Comparative Physiology.*

J. B. B.—John Bagnell Bury. Regius Professor of Modern History, Cambridge University, 1902–27, Regius Professor of Greek, Trinity College, Dublin, 1898–1902 Author of *History of the Roman Empire 27 B.C.–180 A.D.*, etc Editor of Gibbon's *Decline and Fall of the Roman Empire* (1896–1900).

**J. B. Bi.—Joseph Bucklin Bishop.** Former Secretary to the Panama Canal Commission. Author of *The Panama Gateway;* etc.

**J. B. C.—J. B. Crane.** Former Mechanical Engineer, Combustion Engineering Company, Inc., New York, N.Y.

**J. B. Ce.—John B. Condliffe.** Professor of Economics, University of California, Berkeley, Calif. Author of *The Commerce of Nations; The Reconstruction of World Trade.*

**J. Bf.—J. Badeff.** Dramatic Adviser at the National Theatre, Bulgaria.

**J. B. F.—John B. Firth.** Author of *Augustus Caesar; Constantine the Great;* etc.

**J. B. Fh.—James Burgess Fitch.** Professor and Chief of the Dairy Division, University of Minnesota, Department of Agriculture, St. Paul, Minn.

**J. B. Fo.—John B. Foster.** Former Editor of *Spalding's Official Base Ball Guide,* New York, N.Y. Author of *A History of National Association of Professional Base-Ball Leagues.*

**J. B. Fz.—Joe B. Frantz.** Associate Professor of History, University of Texas, Austin, Tex. Author of *Gail Borden, Dairyman to a Nation.*

**J. B. G.—James Bert Garner.** Professor and Senior Fellow, Mellon Institute of Industrial Research, Pittsburgh, Pa. Former Director of Research for Hope and affiliated natural gas companies.

**J. B. Gn.—James B. Griffin.** Director, Museum of Anthropology; Professor of Anthropology, University of Michigan, Ann Arbor, Mich. Author of *Fort Ancient Aspect.* Editor of *Archaeology of Eastern United States.*

**J. B. H.—James Brents Hill.** President of the Louisville and Nashville Railroad Company, Louisville, Ky., 1934–50

**J. B. Hn.—John B. Heffernan.** Rear Admiral, U.S. Navy (retired). Director of Naval History (Op-29), Office of the Chief of Naval Operations, U.S. Department of the Navy, Washington, D.C.

**J. B-J.—John Buettner-Janusch.** National Science Foundation Fellow in Anthropology, The University of Chicago.

**J. B. Jl.—James Bysse Joll.** Fellow of St. Antony's College, Oxford. University Lecturer in Modern History, Oxford University Joint Editor in Chief, *Documents on German Foreign Policy.*

**J. B. Kr.—Joseph B. Kirsner, M.D.** Professor of Medicine, The University of Chicago.

**J. B. L.—John Barger Leighly.** Professor of Geography, University of California, Berkeley, Calif., 1943– . Meteorologist, United States Army Air Forces Weather Service, 1944–46. Councillor, American Meteorological Society, 1937–39.

**J. B. Mu.—James Bass Mullinger.** Former Lecturer in History, St. John's College, Cambridge Author of *History of the University of Cambridge;* etc.

**J. Bn.—John Bryson.** Fellow, Balliol College, Oxford.

**J. B. P.—J. B. Pearman.** Author of *Heel-and-Toe Walking.*

**J. B. Ps.—James Bayard Parsons.** Associate Professor of Chemistry, The University of Chicago. Co-author of *The Study of the Physical World.*

**J. B. R.—John Bernard Reeside, Jr.** Chief, Section of Paleontology and Stratigraphy, U.S. Geological Survey, Washington, D.C.

**J. Bry.—James Bryce, 1st Viscount Bryce.** Statesman, jurist and author. Author of *The American Commonwealth;* etc.

**J. B. Se.—John B. Spore.** Editor, *Combat Forces Journal.*

**J. B. S. H.—John Burdon Sanderson Haldane.** Professor of Biometry, University College, University of London. Fullerian Professor of Physiology, Royal Institution, 1930–32; Professor of Genetics, University of London, 1933-37. Author of *Animal Biology* (with J. S. Huxley); *The Causes of Evolution;* etc.

**J. Bt.—James Bartlett.** Former Lecturer on Construction, Architecture, Sanitation, Quantities, etc., King's College, University of London. Author of *Quantities.*

**J. B. van U.—J. Blan van Urk.** Author of *The Story of American Foxhunting* and *Little Charlie, The Fox.*

**J. B. Wa.—John Barker Waite.** Professor of Law, University of Michigan, Ann Arbor, Mich. Author of *Patent Law;* etc.

**J. C.—John Cadman, 1st Baron Cadman.** Former Professor, Birmingham University, Birmingham, England, Chairman, Anglo-Iranian Oil Company; Consulting Petroleum Adviser, H M Government.

**J. C. A.—James Coats Auchincloss.** Congressman, 1943–53. Former President, The Better Business Bureau of New York, N.Y.

**J. Car.—Jacques Cartier.** Chairman of Cartier, Ltd.

**J. C. B.—J. C. Brooke.** Squadron Leader, R.A.F. Attached British Naval Mission, Ministry of Marine, Athens.

**J. C. Br.—John Christian Bailar, Jr.** Professor of Chemistry and Secretary of the Chemistry Department, University of Illinois, Urbana, Ill.

**J. C. Bt.—John C. Bisset.** Chairman, Billiards Association and Control Council. Editor of the *Billiard Player,* London.

**J. C. By.—John Cary Bellamy.** Former Assistant Professor of Meteorology, The University of Chicago.

**J. C. E.—James Chidester Egbert.** Professor of Latin, 1906–42, and Director, University Extension, 1910–42, Columbia University. General Editor of Macmillan's Series of Latin Classics. Author of *Introduction to the Study of Latin Inscriptions;* etc.

**J. C. Em.—John C. Emison.** Vice-President and Treasurer, American Smelting and Refining Company, New York, N.Y.

**J. C. G. J.—J. C. Griffith Jones.** Journalist and broadcaster. Welsh Correspondent, the *Observer,* London.

**J. C. H.—Rt. Rev. John Cuthbert Hedley, O.S.B., D.D.** Former R.C. Bishop of Newport, England. Author of *The Holy Eucharist;* etc.

**J. C. Hn.—James C. Harrison.** Public Relations Director, U.S. Trotting Association.

**J. C. Hr.—Jerome Clarke Hunsaker.** Professor of Aeronautical Engineering Massachusetts Institute of Technology, Cambridge, Mass. Co-author of *Engineering Applications of Fluid Mechanics.*

**J. Ck.—James Chadwick.** Professor of Physics, University of Liverpool, England. Author of *Reactions from Radioactive Substances;* etc.

**J. Cl.—John Cahill.** Principal Information Officer, Home Office, London.

**J. C. M.—Jonathan Campbell Meakins, M.D.** Former Professor of Medicine, McGill University, Montreal, Que. Author of *Practice of Medicine; Symptoms in Diagnosis.*

**J. C. Ma.—James Clerk Maxwell.** Author of *Electricity and Magnetism; On Faraday's Lines of Force.*

**J. C. Mr.—Jacob Conrad Meyer.** Associate Professor of History, Western Reserve University, Cleveland, O. Author, *Church and State in Massachusetts from 1740 to 1833.*

**J. C. Ms.—J. Clyde Marquis.** American Representative and Vice-President, International Institute of Agriculture, Rome, Italy, 1935–41. Former Director of Economic Information, U.S. Department of Agriculture.

**J. C. My.—Rev. John Courtney Murray, S. J.** Editor, *Theological Studies.*

**J. C. Ns.—Joseph C. Nichols.** Sports Department, the *New York Times.*

**J. C. O.—James C. Olson.** Superintendent, Nebraska State Historical Society. Author of *J. Sterling Morton.*

**J. C. Os.—John Clyde Oswald.** Former President of the New York Employing Printers Association, Inc. Former Editor of *The American Printer.*

**J. C. S.—John C. Sacks.** Captain, formerly with the Northampton Regiment. Lecturer to the Draper's Summer School, Cambridge, 1926. Author of *Furs and the Fur Trade.*

**J. C. Sh.—James C. Shaw.** Commander, U.S.N. Naval Historian, U.S. Naval War College, Newport, R.I. Former Instructor in Strategy and Tactics, U.S. Naval General Line School, Monterey, Calif.

**J. C. Sm.—James Cruickshank Smith.** Former Senior Chief Inspector of Schools in Scotland, 1927–32. Editor of Spenser's *Faerie Queen* and (with Professor E. de Selincourt) of Spenser's *Poetical Works.*

**J. C. Smu.—Jan Christiaan Smuts.** Field Marshal. Prime Minister and Minister of External Affairs and Defense of South Africa, 1939–48. Author of *Holism and Evolution; Plans for a Better World;* etc.

**J. C. T.—Joshua C. Taylor.** Assistant Professor, Department of Art and the College, The University of Chicago.

**J. C. Van D.—John Charles Van Dyke.** Professor of the History of Art, Rutgers College, New Brunswick, N.J., 1889–1932. Former Editor, *Studio* and *Art Review.* Author of *Art for Art's Sake; History of Painting;* etc.

**J. Da.—Rev. James Davies.** Former Head Master of Ludlow Grammar School and Prebendary of Hereford Cathedral, England. Translated classical authors for Bohn's "Classical Library" Author of volumes in Collins' *Ancient Classics for English Readers*

**J. D. B.—James David Bourchier.** Former Correspondent of *The Times*, London, in southeastern Europe

**J. D. Be.—John Desmond Bernal.** University Professor of Physics Birkbeck College, University of London, 1937– . Assistant Director of Research in Crystallography, Cambridge University, 1934–37.

**J. D. Bl.—John Donald Black.** Professor of Economics, Harvard University, 1927– . Chief Economist, Federal Farm Board, 1931–32. Consulting Economist, U S. Department of Agriculture, 1937–40, War Food Administration, 1943; Tennessee Valley Authority, 1940– . Former Professor of Agricultural Economics and Chief of the Division, University of Minnesota, Minneapolis, Minn. Author of *Agricultural Reform in the United States;* etc.

**J. D. Ee.—John D. Eyre.** Assistant Professor, Department of Geography, University of Washington, Seattle, Wash.

**J. D. F.—John Donnelly Fage.** Senior Lecturer and Head of the Department of History, University College of the Gold Coast, Achimota, Gold Coast.

**J. D. Fn.—John Derek Freeman.** Lecturer in Anthropology, University of Otago, Dunedin, N.Z.

**J. D. H.—John Donald Hicks.** Morrison Professor of American History, University of California, 1942– . Professor of History, 1932–42, and Chairman, Department of History, 1938–42, University of Wisconsin, Madison Author of *The American Nation;* etc.

**J. D. Hd.—Joseph Douglas Hood.** Associate Professor of Biology, Cornell University, Ithaca, N.Y.

**J. D. H. D.—Joseph Désiré Hubert Donnay.** Professor of Crystallography and Mineralogy, The Johns Hopkins University, Baltimore, Md. Author of *Spherical Trigonometry After the Cesàro Method.*

**J. D. L.—James Douglas Lambert.** Foreign Office Research Department, London. Author of *The Overburean Characters; Parliament in Debate.*

**J. D. Ls.—Jo Desha Lucas.** Assistant Dean and Dean of Students, the Law School, The University of Chicago.

**J. D. M.—John David Mabbott.** Tutor and Lecturer in Philosophy, St. John's College, Oxford. Author of *The State and the Citizen.*

**J. D. M. S.—J. D. Main Smith.** Former Research Assistant to the Professor of Chemistry, University of Birmingham, England, and Examiner in Chemistry, University of London. Author of *Chemistry and Atomic Structure;* etc

**J. D. N.—John Douglas Newth.** Honorary Secretary of the British Council for Doctor Albert Schweitzer's Hospital

**J. D. Pr.—John Dyneley Prince.** Former Professor of East European Languages at Columbia University.

**J. D. R.—J. D. Ryder.** Professor and Head of the Department of Electrical Engineering, University of Illinois, Urbana, Il. Author of *Electronic Engineering Principles; Electronic Fundamentals and Applications; Networks, Lines, and Fields.*

**J. D. S.—John Duncan (Ernst) Spaeth.** First President, University of Kansas City, Mo, 1933–36 Amateur Coach and Director of Rowing, Princeton, 1910–25 Murray Professor of English Literature, Princeton University, 1930–35 Author of *Camp Reader for American Soldiers;* etc.

**J. D. Sn.—James Docking Stranathan.** Professor of Physics and Chairman, Department of Physics and Astronomy, University of Kansas, Lawrence, Kan Author of *The "Particles" of Modern Physics*

**J. Dz.—Rev. Jean Delanglez, S.J.** Former Professor of History, Lovola University, Chicago, Ill Author of *El Rio del Espiritu Santo; Hennepin's Description of Louisiana; Life and Voyages of Louis Jolliet;* etc

**J. E. B. G.—John Evelyn Bury Gray.** Lecturer in Sanskrit, School of Oriental and African Studies, London.

**J. E. C.—Janet Elizabeth Courtney.** Member of Executive Committee, Carnegie United Kingdom Trust, 1913– . Author of *Recollected in Tranquillity; The Women of My Time;* etc.

**J. E. E.—Sir James Edward Edmonds.** Brigadier General. Officer in Charge of Military Branch, Historical Section, Committee of Imperial Defense, London. Served in South African and European wars Author of *A Handbook of the German Army; Official History of the War;* etc.

**J. E. F.—James Everett Frame.** Baldwin Professor of Sacred Literature in Union Theological Seminary, New York, N.Y, 1919–38. Author of *Purpose of New Testament Theology.*

**J. E. Fi.—Joel E. Fisher.** Former President, American Alpine Club.

**J. E. Fr.—James Earle Fraser.** Former Director, Art Students League, New York, N.Y.

**J. E. Gg.—John Eldon Gieseking.** Professor of Soil Physics, University of Illinois, Urbana, Ill, and Chief, Illinois Soil Survey, 1945– .

**J. E. H.—John Edgar Hoover.** Director, Federal Bureau of Investigation, United States Department of Justice.

**J. E. Hl.—John Eric Hill.** In Charge, Department of Comparative Anatomy, 1941–47, Assistant Curator, Department of Mammals, 1935–41, The American Museum of Natural History, New York, N.Y.

**J. E. Hs.—J. Edward Hedges.** Professor of. Insurance, Indiana University, Bloomington, Ind. Author of *Compensation of Life Insurance Agents; Practical Fire and Casualty Insurance.*

**J. E. H. W.—John Eryl Hall Williams.** Barrister-at-law Lecturer in Law, London School of Economics and Political Science, University of London

**J. E. K.—James Edward Knott.** Professor of Truck Crops and Head of Division, College of Agriculture, University of California, 1940– .

**J. E. L.—Sir John Edward Lloyd.** Emeritus Professor of History, University College of North Wales, Bangor, 1930–47 Former President of the Welsh Language Society. Author of *A History of Wales to the Edwardian Conquest;* Editor of Hubert Lewis' *Ancient Laws of Wales*

**J. E. Lr.—John Everts Lamar.** Geologist and Head of the Industrial Minerals Division, Illinois State Geological Survey.

**J. E. M.—James Elvins McCartney, M.D.** Major, R.A.M.C Director of Research and Pathological Services, London County Council Former Lecturer in Bacteriology, University of Edinburgh, Scotland Co-author of *A Handbook of Practical Bacteriology.*

**J. E. Me.—Joseph Earle Moore, M.D.** Associate Professor of Medicine, The Johns Hopkins University, 1916–45, Physician-in-charge, Syphilis Division, Medical Clinic, The Johns Hopkins Hospital, Baltimore, Md. Author of *The Modern Treatment of Syphilis;* etc.

**J.-E.-M.-G. D.—Joseph-Edouard-Marie-Ghislain Delmelle.** Honorary President of Jeunes Écrivains Belges. Author of *Histoire des lettres belges d'expression française, Panorama de la jeune poésie française en Belgique; Profondeur de la mer;* etc.

**J. E. Mu.—John E. Muhlfeld.** Author of *Locomotives of Great Power; New Era for Steam Locomotives, etc.*

**J. E. My.—James Edward McMurtrey, Jr.** Principal Physiologist, Division of Tobacco Investigations, Bureau of Plant Industry, Soils, and Agricultural Engineering, U S. Department of Agriculture.

**J. En.—Jeannette Eckman.** Historian and Director, New Castle Tencentenary Commission.

**J. E. S.—John Edward Sears.** Former Superintendent of Metrology Department, National Physical Laboratory, England.

**J. E. Sa.—Sir John Edwin Sandys.** Former Public Orator, Cambridge University. Author of *History of Classical Scholorship.*

**J. E. Spr.—J. E. Springmeyer.** Legislative Counsel, State of Nevada, Carson City, Nev.

**J. E. S. S.—Jocelyn Edward Salis Simon.** King's Counsel, London.

**J. E. T. H.—John Ernest Troyte Harper.** Vice-Admiral, R.N. Director of Navigation at the Admiralty, 1919–21. Author of *The Royal Navy at War;* etc.

**J. Ev.—Joan Evans.** External Examiner in History of Art, University of London, 1938–46. Author of *English Jewellery;* etc.

**J. E. W.—James Edward West.** Chief Scout, Boy Scouts of America, 1943–48 Author of *The Lone Scout of the Sky;* etc.

**J. E. Ws.—John Elliot Wills.** Associate Professor of Farm Management, College of Agriculture, University of Illinois, Urbana, Ill.

**J. F.—John Fiske.** Sometime History Tutor at Harvard University. Author of *The American Revolution;* etc.

**J. F. C.—James Ford Cairns.** Lecturer in Economic History, University of Melbourne, Melbourne, Austr.

**J. F. C. F.—John Frederick Charles Fuller.** Major General (retired). Former Military Assistant to the Chief of the Imperial General Staff. Chief General Staff Officer, Tank Corps, 1917–18. Author of *The Reformation of War;* etc.

**J. F. Do.—James F. Doster.** Assistant Professor of History, University of Alabama, University, Ala. Author of *Alabama's First Railroad Commission, 1881–1885.*

**J. F. Fy.—Joseph F. Farley.** Commandant, United States Coast Guard, 1946–50.

**J. F. G.—John Frank Gregg.** Town Clerk, Birmingham, Eng.

**J. F. G. P.—Sir James Frederick George Price.** Deputy Secretary, Ministry of Labour, London, 1935–38.

**J. Fi.—Jack Filman.** Hockey Department, Madison Square Garden, New York, N.Y.

**J. F.-K.—James Fitzmaurice-Kelly.** Former Gilmour Professor of Spanish Language and Literature, University of Liverpool, England. Author of *A History of Spanish Literature.*

**J. F. Ki.—James F. King.** Assistant Professor of History, University of California, Berkeley, California.

**J. F. M.—James Fullarton Muirhead.** Former Editor of many of Baedeker's Guide Books Author of *America, the Land of Contrasts;* etc.

**J. F. Md.—J. F. Madden.** Member of the Sudan Political Service.

**J. F. Mi.—John F. Mitchell.** Assistant Professor of History, American International College, Springfield, Mass.

**J. Fn.—Jack Fulton.** Director, International Recreation Association.

**J. Fo.—Sir John William Fortescue.** Librarian at Windsor Castle, 1905–26. Author of *Wellington; History of the 17th Lancers;* etc.

**J. F. P.—Joseph Frank Payne, M.D.** Former Harveian Librarian, Royal College of Physicians. Author of *Lectures on Anglo-Saxon Medicine;* etc.

**J. Fr.—Jacob Fisher.** Office of the Commissioner; Social Security Administration; Department of Health, Education and Welfare, Washington, D.C.

**J. F. R.—James Frederick Rees.** Principal of University College of South Wales and Monmouthshire, Cardiff. Professor of Commerce, University of Birmingham, England, 1925–29.

**J. F. Ri.—Joseph Fels Ritt.** Professor of Mathematics and Executive Officer, Department of Mathematics, Columbia University, 1942–45. Author of *Differential Equations from the Algebraic Standpoint.*

**J. F. S.—John Frederick Stenning.** Warden of Wadham College, Oxford, 1927–38. Former University Reader in Aramaic.

**J. F. Sm.—Rev. John Frederick Smith.** Author of *Studies in Religion under German Masters;* etc.

**J. F. Ss.—John F. Simmons.** Chief of Protocol, U.S. Department of State, Washington, D.C.

**J. F. Sy.—Rev. John F. Sweeney, S.J.** Professor of Humanities, Woodstock College, Woodstock, Md.

**J. F. W.—John Forbes White.** Co-Author of *Life and Art of G. P. Chalmers, R.S.A.*

**J. F. Wr.—J. Frederic Walker.** Research Supervisor, Technical Division, Electrochemicals Department, E I. du Pont de Nemours & Co., Inc., Perth Amboy, N.J.

**J. Gai.—James Gairdner.** English historian and Sometime Assistant Keeper of the Public Records Editor of the *Paston Letters; Letters and Papers Illustrative of the Reigns of Richard III, Henry VII, and Henry VIII.* Author of *The House of Lancaster and York;* etc.

**J. Gal.—Jean Gallotti.** Supervisor of Native Moroccan Arts. Instructor of History of Mohammedan Art, University of Bordeaux, France.

**J. M. Wr.—J. Marvin Weller.** Professor of Invertebrate Palaeontology, The University of Chicago.

**J. M. Wt.—James Muir Watt.** Joint Assistant Secretary, The Chartered Auctioneers' and Estate Agents' Institute, London Author of *The Agriculture Act, 1947, The Agricultural Holdings Act, 1948; The Landlord and Tenant (Rent Control) Act, 1949; The Leasehold Property (Temporary Provisions) Act, 1951.*

**J. N.—John Nichol.** Professor of English Literature, Glasgow University, Glasgow, Scotland, 1862–89. Author of *Robert Burns; Carlyle;* etc.

**J. Na.—James Naismith, M.D.** Formerly with Department of Physical Education, University of Kansas, Lawrence, Kan Author of *Basketball Rules.* Originator of the game of basketball.

**Jn. B.—John Blackmore.** General Church Historian, Reorganized Latter Day Saints Church.

**J. N. Bl.—Joseph N. Bell.** Manager, Public Relations Bureau, Portland Cement Association.

**J. Ne.—Joseph Needham.** Director of the Section of Natural Sciences, UNESCO. Fellow of Gonville and Caius College and Sir William Dunn Reader in Biochemistry, Cambridge. Author of *Chemical Embryology;* etc.

**J. N. H.—John Newbold Hazard.** Professor of Public Law, Columbia University, New York, N.Y. Author of *Soviet Housing Law.*

**J. N. K.—Sir John Noble Kennedy.** Major General. Governor of Southern Rhodesia, 1946–54. War Office, London. 1940. Assistant Chief of Imperial General Staff, 1943–45.

**J. N. P.—John Norman Pring.** Principal Senior Officer, Armament Research Department, Woolwich, England Former John Hastings Professor in Physics and Reader in Electro-Chemistry, Victoria University, Manchester. Author of *The Electric Furnace;* etc.

**J. Ns.—Jerome Namias.** Chief, Extended Forecast Section, U.S. Weather Bureau, Washington, D.C. Author of *An Introduction to the Study of Air Mass and Isentropic Analysis;* etc.

**Jn. W. G.—John W. Gruner.** Professor of Geology and Mineralogy, University of Minnesota, Minneapolis, Minn.

**J. O.—Josiah Oldfield, M.D.** Lieutenant Colonel Founder of the Humanitarian Hospital of St. Francis Former Warden of and Senior Physician to the Lady Margaret Fruitarian Hospital, Staveley, Eng. Author of *Eat and Keep Well; Flesh-Eating a Cause of Consumption;* etc.

**J. O. B.—John Oliver Borley.** Former Principal Naturalist, Ministry of Agriculture and Fisheries, London.

**Jo. G.—Joseph Gilbert.** Technical Editor, *Society of Automotive Engineers Journal,* New York, N.Y.

**Jo. Gr.—John Glaister, M.D.** Regius Professor of Forensic Medicine, University of Glasgow, Glasgow, Scot Author of *Medical Jurisprudence and Toxicology;* co-author of *Medico-Legal Aspects of the Ruxton Case.*

**J. O. K.—John Otto Kraehenbuehl.** Professor of Electrical Engineering, University of Illinois, Urbana, Ill. Author of *Electrical Illumination.*

**J. O. M. B.—Jan O. M. Broek.** Associate Professor in Geography, University of California, Berkeley, Calif. Research Associate, American Council, Institute of Pacific Relations, New York, N.Y.

**J. O. McC.—John Oppie McCall, D.D.S.** Associate in Public Health and Preventive Medicine, Cornell University Medical College. Director, Murry and Leonie Guggenheim Dental Clinic, 1931–46. Former Professor of Periodontia, New York University College of Dentistry, New York, N.Y. Author of *Fundamentals of Dentistry in Medicine and Public Health.*

**Jo. M. L.—John M. Letiche.** Assistant Professor of Economics, University of California, Berkeley, Calif. Visiting Professor of Economics, University of Aarhus, Aarhus, Den., 1951–52. Author of *Reciprocal Trade Agreements in the World Economy.*

**Jo. P.—John Pantin.** Superintendent, American Printing Ink Company, Chicago, Ill.

**J. P.—John Percival.** Professor of Agricultural Botany, University of Reading, England, 1903–32. Author of *The Wheat Plant;* etc.

**J. Pa.—John Leslie Palmer.** Author of *Peter Paragon; The Happy Fool; The Future of the Theatre;* etc.

**J. P.-B.—James Penderel-Brodhurst.** Former Consulting Editor, Editor of *The Guardian,* London.

**J. P. Bo.—John Poland Bowen.** Engineer in Chief, Corporation of Trinity House, London.

**J. P. Bt.—John Paul Blewett.** Research Physicist, Research Laboratory, General Electric Company, Schenectady, N.Y.

**J. P. D.—James P. Dawson.** Former Boxing Editor, the *New York Times.*

**J. Pe.—Jean Perrin.** Former Professor of Physical Chemistry at the Sorbonne, Paris Nobel Prize for Physics, 1926.

**J. P. E.—Jean Paul Hippolyte Emmanuel Adhémar Esmein.** Former Professor of Law, University of Paris. Author of *Cours élémentaire d'histoire du droit français.*

**J. P. Ea.—John P. Earnest.** Former Professor of Criminal Law, George Washington University, Washington, D.C.

**J. Per.—Janet Perry.** Lecturer in the Department of Spanish Studies, King's College, University of London. Editor of Juan de Valdés' *Diálogo de las lenguas.*

**J. P. G.—John P. Gillin.** Professor of Anthropology and Research Professor, University of North Carolina, Chapel Hill, N.C. Author of *The Barama River Caribs of British Guiana; The Ways of Men.*

**J. P. Hy.—James Philip Hyatt.** Professor of Old Testament, Vanderbilt University, Nashville, Tenn Author of *Prophetic Religion*

**J. Pi.—Jacques Pirenne.** Formerly Secretary to King Leopold III Professor of History of Civil Law, University of Brussels, 1924– Tutor to Prince Leopold of Belgium (later King Leopold III), 1920–24. Author of *A History of Europe.*

**J. P. L.—James P. Leake, M.D.** Former Medical Director, U.S. Public Health Service.

**J. P. L. S.—Jacobus Petrus Lodewicus Snyman.** Lecturer in English, Northern Cape Technical College, Kimberley, U. of S. Af. Author of *A Bibliography of South African Novels in English; The South African Novel in English.*

**J. P. M.—James Philip Mills.** Former Assistant Commissioner, Makokehung, Assam. Fellow of Royal Asiatic Society of Bengal, India. Author of *The Lhota Nagas.*

**J. P. Me.—John Percy Moore.** Emeritus Professor of Zoology, University of Pennsylvania, Philadelphia, Pa. Author of *Leeches of Minnesota.*

**J. P. Mn.—John P. Maxton.** Institute of Agrarian Affairs, Oxford, England.

**J. P. Mt.—John Perry Moffett.** Principal Assistant Secretary, the Secretariat, Tanganyika. Co-author of *Tanganyika: A Survey of Its Resources and Their Development.*

**J. Pp.—James Philp.** Clerk to the Skye District Council, Skye, Scot.

**J. P. P.—John Percival Postgate.** Former Professor of Latin in the University of Liverpool, England. Former Editor, *Classical Quarterly.* Former Editor in Chief, *Corpus Poetarum Latinorum;* etc.

**J. Pr.—Joseph Proudman.** Professor of Oceanography, University of Liverpool, England, 1940–46. Pro-Vice-Chancellor and Director of Liverpool Observatory and Tidal Institute, 1919–45.

**J. Pre.—John Price.** Secretary, Research Department, Transport and General Workers' Union, London, England. Author of *Organised Labour in the War;* etc.

**J. Ps.—John Purves.** Emeritus Reader in Italian, University of Edinburgh, Edinburgh, Scot. Author of *A First Book of Italian Verse.* Co-editor of *A Dictionary of Modern Italian; Works of William Fowler.*

**J. P. S.—John P. Sheehan.** Supervisor, Metals Department Armour Research Foundation, Illinois Institute of Technology, Chicago, Ill.

**J. P. Sp.—John Philip Spielman.** Professor of Metallurgy, Montana School of Mines, Butte, Mont.

**J. Pt.—Joseph Prescott.** Associate Professor of English, Wayne University, Detroit, Mich.

**J. P. T. B.—John Patrick Tuer Bury.** Fellow and Librarian of Corpus Christi College, Cambridge. University Lecturer in History, Cambridge University Author of *Gambetta and the National Defence;* etc.

**J. Pz.—John Petrov Plamenatz.** Fellow of Nuffield College, Oxford. Author of *The English Utilitarians; The Revolutionary Movement in France (1815–71).*

**J. R.—J. Romanes.** Petroleum geologist.

**J. R. A.—James Russell Andrus.** Former Visiting Professor, University of Redlands, California Professor of Economics, University of Rangoon, Burma, 1936–40.

**J. R. A. N.—John Ramsey Allardyce Nicoll.** Professor of English, Birmingham University, Birmingham, Eng Author of *A History of Early Eighteenth Century Drama; Studies in Shakespeare; World Drama;* etc

**J. R. Dy.—J. R. Dymond.** Professor of Systematic Zoology, University of Toronto, Canada Director, Royal Ontario Museum of Zoology, Toronto.

**J. Rei.—Jacob Reighard.** Former Professor in Zoology, University of Michigan, 1927–42. Director of the Biological Survey of the Great Lakes for the U.S. Fish Commission, 1898–1901.

**J. R. F.—John Ritchie Findlay.** Author of *Personal Recollections of De Quincey.*

**J. R. G.—John Robert Griffin.** General Secretary, British Legion.

**J. Ri.—James Ritchie.** Professor of Natural History and Dean of the Faculty of Science, Edinburgh University, Scotland. Keeper of the Natural History Department, Royal Scottish Museum, Edinburgh, 1921–30 Author of *Influence of Man on Animal Life in Scotland.* Editor of the *Scottish Naturalist.* G4085

**J. Rk.—John Rock, M.D.** Director of the Fertility, Endocrine and Rhythm Clinics and Visiting Surgeon, Free Hospital for Women, Brookline, Mass. Research Associate in Obstetrics and Gynaecology, Harvard Medical School, Boston, Mass.

**J. Rm.—J. Ramsbottom.** Keeper of Botany, British Museum (Natural History), London. Co-editor of the *Journal and Transactions of the British Mycological Society.*

**J. R. M.—Rt. Hon. James Ramsay MacDonald.** Prime Minister and First Lord of the Treasury, 1929–35. Prime Minister, First Lord of the Treasury and Secretary of State for Foreign Affairs, Jan.-Nov. 1924. Chief British Delegate to and Chairman of the London Naval Conference, 1930. **J. R. Mag.—John Robert Magness.** Head Horticulturist in Charge of Division of Fruit and Vegetable Crops and Diseases, Bureau of Plant Industry, U.S. Department of Agriculture, 1941– .

**J. R. Mar.—John Richardson Marrack, M.D.** Professor of Chemical Pathology, University of London. Author of *The Chemistry of Antigens and Antibodies; Food and Planning.*

**J. R. Ms.—Jacob Rader Marcus.** Professor of Jewish History, Hebrew Union College, Cincinnati, O. Author of *Rise and Destiny of the German Jew;* etc.

**J. Ros.—Julius Rosenwald.** Former Chairman of the Board, Sears, Roebuck and Company, Chicago, Ill.

**J. R. P.—James Riddick Partington.** Professor of Chemistry, East London College, University of London Author of *A Textbook of Inorganic Chemistry for University Students;* etc.

J. R. Pk.—**J. Roland Pennock.** Professor and Chairman, Department of Political Science, Swarthmore College, Swarthmore, Pa. Author of *Administration and the Rule of Law.*

J. R. R.—**John R. Riddell.** Former Principal of the London School of Printing and Kindred Trades. Author of *The Training of the Printer.*

J. R. Rn.—**John Reginald Richardson.** Physicist, Radiation Laboratory, University of California, Berkeley, Calif.

J. R. Ro.—**James Rennell Rodd, 1st Baron** [illegible] Ambassador to the Court of Italy, 1908–19, Secretary of Legation, Cairo, 1894–1901, Counsellor of Embassy at Rome, 1901–14

J. R. T.—**Joseph Robson Tanner.** Lecturer in History at St John's College, University of Leeds, England, 1883–1921. Author of *Pepys's Naval Minutes;* etc.

J. R. Th.—**Sir James Richard Thursfield.** Former Dean, Fellow, Lecturer and Tutor of Jesus College, Oxford. Author of *Peel,* etc.

J. R. Tu.—**John R. Tunis.** Writer on sporting subjects.

J. R. W.—**James Robert Wilson, M.D.** Secretary, Council on Foods and Nutrition, American Medical Association.

J. S.—**Josiah Charles Stamp, 1st Baron Stamp.** Former Chairman and President of the Executive, London, Midland and Scottish Railway. Former Director of the Bank of England. Author of *Wealth and Income of the Chief Powers;* etc.

J. Sa.—**John Sankey, 1st Viscount of Moreton.** Lord Chancellor, 1929–35. Lord Justice of Appeal, 1928–29.

J. S. B.—**John Sutherland Black.** Former Co-editor of *The Encyclopaedia Biblica.*

J. S. Be.—**Rev. Canon James Stanley Bezzant.** Canon Residentiary and Chancellor of Liverpool Cathedral, Liverpool, England.

J. S. By.—**John Sherman Beekley.** Chemical Director, Ammonia Department, E. I. du Pont de Nemours & Co., Wilmington, Del.

J. S. Co.—**James Sutherland Cotton.** Former Editor of *The Imperial Gazetteer of India.* Author of *India* in the "Citizen" Series.

J. S. D.—**J. S. Davis.** Secretary to the Education Authority for the County of Norfolk, England, and former Vice-Principal and Master of Method to the Culham Training College.

Js. F.—**James Franck.** Professor of Physical Chemistry, Department of Chemistry, The University of Chicago. Author of *Anregung von Quantensprungen.*

J. S. F.—**Sir John Smith Flett.** Director, Geological Survey of Great Britain and Museum of Practical Geology. 1920–35 Former Lecturer on Petrology in Edinburgh University, Scotland.

J. S. Fa.—**John Shields Fairbairn, M.D.** Former Consulting Obstetric Physician and Gynaecologist, St Thomas's Hospital. Former Consulting Physician, General Lying-in-Hospital, London. Author of *Gynaecology, with Obstetrics;* etc. Former Editor of *Journal of Obstetrics and Gynaecology of the British Empire.*

J. S. H.—**Julian Sorell Huxley.** Honorary Lecturer, King's College, University of London, 1927–35 Former Fullerian Professor of Physiology in the Royal Institution. Author of *Essays of a Biologist; Evolution, The Modern Synthesis;* etc.

J. Si.—**J. Sime.** Author of *A History of Germany.*

J. Sib.—**Rev. James Sibree, D.D.** Former missionary of London Missionary Society. Author of *Madagascar and Its People;* etc.

J. S. K.—**Sir John Scott Keltie.** Secretary, Royal Geographical Society, 1892–1915. Former Editor of *Statesman's Year-Book; Geographical Journal*

J. S. L.—**John Silas Lundy, M.D.** Senior Consultant, Section on Anaesthesiology, Mayo Clinic, Rochester, Minn Professor of Anaesthesiology, Mayo Foundation for Medical Education and Research, University of Minnesot[illegible] Minn. Author of *Clinical* [illegible] *Manual of Clinical Anesthesiology.*

J. S. M.—**John Schoff Millis.** President, Western Reserve University, Cleveland, O. Author of *Laboratory Outline of Physics.*

J. S. McD.—**J. S. McDaniel.** Secretary, Cordage Institute, New York, N.Y.

J. S. M. W.—**John Sebastien Marlow Ward, D.D.** Father Superior of Confraternity of the Kingdom of Christ (Orthodox Catholic Church in England), and Director of the Abbey Folk Park and Museum Author of *An Outline History of Freemasonry;* etc.

J. S. No.—**John Samuel Noffsinger.** Director, National Home Study Council, Washington, D.C. Author of *Correspondence Schools, Chautauquas and Lyceums,* etc.

J. Sp.—**John Sparrow.** Fellow of All Souls College, Oxford.

J. S. P.—**J. S. Prendergast.** Formerly with Worcester College, Oxford

J. S. R.—**James Smith Reid.** Former Professor of Ancient History in Cambridge University and Fellow and Tutor [illegible] and Caius College. Former Editor of Cicero's *Academica;* etc

J. S. Rb.—**Jane Sands Robb, M.D.** Associate Professor of Pharmacology, College of Medicine, Syracuse University, Syracuse, N.Y.

J. Ss.—**Joel Stebbins.** Director, Washburn Observatory and Professor of Astronomy, University of Wisconsin, Madison, Wis. Research Associate, Mount Wilson Observatory, Pasadena, Calif.

J. S. S.—**John Stuart Scrimgeour.** Barrister-at-Law of the Middle Temple.

J. S. Sm.—**John Samuel Stamm, D.D.** Vice-President of Executive Committee, World Council of Churches. Senior Bishop and President of Board of Bishops of the Evangelical Church in the Eastern Area of the Church 1936–46. President, Evangelical School of Theology, 1935–41.

J. S. T.—**John Spencer Thompson.** President, Mutual Benefit Life Insurance Company of Newark, N.J. 1946–53.

J. Sw.—**Joseph Swire.** Former Member of the Royal Institute of International Affairs, and of the Balkan Committee.

J. S. W.—**Sir John Stephen Willison.** Former Editor of the [illegible], Toronto, Canada. Author of *Sir Wilfrid Laurier and the Liberal Party;* etc

J. T. A.—**James Truslow Adams.** Editor in Chief, *Atlas of American History,* 1943. Author of *Founding of New England;* etc.

J. T. Be.—**John Thomas Bealby.** Co-author of Stanford's *Europe;* former Editor of the *Scottish Geographical Magazine* Translator of Sven Hedin's *Through Asia, Central Asia and Tibet*

J. T. Bz.—**John Theodore Buchholz.** Former Professor of Botany, University of Illinois, Urbana, Ill. Head of the Department, 1938–42 Former President of the Botanical Society of America

J. Te.—**Rev. John Telford.** Wesleyan Methodist Connexional Editor, 1905–36 Editor of *Wesleyan Methodist Magazine; Preacher's Magazine;* etc. Author of *Life of John Wesley;* etc.

J. T. F.—**John Thomson Faris, D.D.** Director, Editorial Division of the Board of Christian Education of the Presbyterian Church in U.S.A., 1923–37 Author of *Where Our History Was Made;* etc

J. T. G. O.—**Jan Theodoor Gerard Overbeek.** Professor of Physical Chemistry, University of Utrecht, Utrecht, Neth. Co-author of *Introduction to Physical Chemistry, Theory of the Stability of Lyophobic Colloids*

J. T. Hk.—**John Tilton Hack.** Senior Geologist, U.S Geological Survey, Washington, D.C.

J. T. Hl.—**John Thomas Howell.** Assistant Curator, Department of Botany, California Academy of Science, San Francisco, Calif.

J. T. M.—**John Torrey Morse, Jr.** Author of *The Life and Letters of Oliver Wendell Holmes;* etc

J. T. Ma.—**John Thomas Madden.** Dean, New York University School of Commerce, Accounts and Finance, New York, N.Y., 1925–48. Former Director, Institute of International Finance. Co-author of *Elementary Accounting Problems;* etc

J. T. McG.—**John Terrence McGovern.** Lawyer, and Promoter of Public Recreation and Counsellor to Carnegie Foundation for the Advancement of Teaching Director, Pan-American Sports Congress and U.S. Sports Federation, 1941.

J. T. W.—**John Tracy Winterich.** Author, editor and critic Author of *Early American Books and Printing; Twenty-three Books and the Stories Behind Them.*

J. T. N.—**John T. Nichols.** Curator of Fishes, The American Museum of Natural History, New York, N.Y. Author of *Freshwater Fishes of China.*

J. T. Nn.—**James T. Nicholson.** Executive Vice President, American National Red Cross.

J. T. P.—**Joseph Thomas Pardee.** Geologist.

J. T. S.—**James Thomson Shotwell.** President, Carnegie Endowment for International Peace, New York, N.Y. Emeritus Bryce Professor of History of International Relations, Columbia University. Chairman, National Committee of U.S.A. on International Intellectual Co-operation of League of Nations, 1932–43.

**J. U.—Joseph Urban.** Architect, decorator and scenic designer. Author of *A Book of Theatres.*

**Ju. H.—Julius Hays Hess, M.D.** Emeritus Professor of Pediatrics, University of Illinois College of Medicine, Chicago. Member advisory committee, Children's Bureau, Federal Security Agency, Washington, D C. Former President, Chicago Medical Society.

**J. V.—Jules Viard.** Former Archivist of the National Archives, Paris.

**J. Van Br.—John Van Brunt.** Vice-President in charge of Engineering Combustion Engineering Company, Inc., New York, N.Y (1933–48)

**J. V. B.—James Vernon Bartlet, D.D.** Former Professor of Church History, Mansfield College, Oxford. Author of *The Apostolic Age,* etc

**J. V. C.—James V. Cunningham.** Associate Professor of English, Brandeis University, Waltham, Mass Author of *The Helmsman; The Judge Is Fury.*

**J. V. D.—James Viner Delahaye.** Colonel President, No. 1 War Office Selection Board (Experimental), 1942–43 General Staff, War Office, 1925–28

**J. V. H.—J. Vincent Higginson.** Managing Editor, the *Catholic Choirmaster.* Member of the faculty, Pius X School of Liturgical Music, New York, N.Y. Secretary, Society of St Gregory of America.

**J. Vi.—Jonas Viles.** Former Professor of American History, University of Missouri, Columbia, Mo. Author of *Archives of Missouri; History of Missouri*

**J. V. M.—J. V. Morton.** Editor, *Wine Trades Review,* London

**J. W.—John Westlake.** Professor of International Law, Cambridge University, 1888–1908 Author of *A Treatise on Private International Law, or the Conflict of Laws.*

**J. Wa.—James Walker.** Clerk of Justiciary Scotland, 1940–48. Author of *Intestate Succession in Scotland;* etc.

**J. W. A.—James Wendell Alexander.** Professor, Institute for Advanced Study, Princeton University.

**J. Wal.—Jan Walch.** Former Lecturer on Drama, University of Leyden, Netherlands.

**J. War.—James Ward.** Former Professor of Mental Philosophy and Logic in Cambridge University.

**J. W. Br.—John W. Bricker.** United States Senator from Ohio, Washington, D.C.

**J. W. Bs.—Jesse Wakefield Beams.** Professor of Physics, University of Virginia, Charlottesville, Va.

**J. W. C.—John William Cobb.** Former Livesey Professor of Coal, Gas and Fuel Industries, University of Leeds, Leeds, Eng.

**J. W. Ck.—James Wilfred Cook.** Regius Professor of Chemistry, University of Glasgow, Glasgow, Scot

**J. W. Cr.—John Wesley Coulter.** Professor of Geography, University of Cincinnati, Cincinnati, O. Author of *Fiji: Little India of the Pacific; A Gazetteer of the Territory of Hawaii; Land Utilization in the Hawaiian Islands.*

**J. W. Ct.—John Winter Crowfoot.** Former Chairman, Palestine Exploration Fund. Former Director, British School of Archaeology in Jerusalem. Author of *Early Churches in Palestine; Samaria-Sebesh I and II.*

**J. W. En.—Joseph Wechsler Eaton.** Director of Research, Rural Settlement Institute, New York, N Y. Author of *Research Guide to Cooperative Group Farming;* etc.

**J. W. Ev.—J. W. Evans.** Lecturer in Pathology Imperial College of Science and University of London, 1912–27.

**J. W. F.—John Watson Foster.** Former Professor of American Diplomatics, George Washington University, Washington, D.C. Former U S. Secretary of State. Author of *Diplomatic Memoirs;* etc.

**J. W. Fe.—J. Walter Ferrier.** Translated Kaufmann's *George Eliot and Judaism.* Author of *Mottischiffe.*

**J. W. G.—John Walter Gregory.** Professor of Geology, University of Glasgow Scotland, 1904–29 Author of *The [illegible] of British East Africa;* etc.

**J. Wh.—Joshua Whatmough.** Professor and Chairman of the Department of Comparative Philology, Harvard University Sometime Faulkner Fellow of the University of Manchester and Research Student (Craven Award) of Cambridge University Author of *The Prae-Italic Dialects of Italy.* Editor of Harvard Studies in Classical Philology, 1932–34 and 1941–44.

**J. W. Hh.—Joel Walker Hedgpeth.** Marine Biologist, Texas Game, Fish and Oyster Commission, Rockport, Tex

**J. W. H.-M.—James Wycliffe Headlam-Morley.** Former Historical Adviser to the Foreign Office, London. Former Fellow of King's College, Cambridge Assistant Director, Political Intelligence Department of the Foreign Office, 1918–20. Author of *The History of Twelve Days; The Issue;* etc.

**J. W. Ho.—J. W. Holloway, Jr.** Director, Bureau of Legal Medicine and Legislation, American Medical Association, 1942–

**J. Wi.—James Williamson.** Member of the firm of Sir Alexander Gibb and Partners, London.

**J. Wil.—James Williams.** Former All Souls Reader in Roman Law, Oxford University, and Fellow of Lincoln College, Oxford.

**J. W. J.—James Weldon Johnson.** Former Secretary of the National Association for Advancement of Colored People and Director of the American Fund for Public Service. U.S Consul to Puerto Cabello, 1906; Corinto, 1909–12. Author of *The Book of American Poetry;* etc.

**J. W. J. C.—J. W. J. Carpender, M.D.** Associate Professor of Radiology, The University of Chicago.

**J. W. Js.—Jenkin William Jones.** Senior Agronomist, in charge of Rice Production and Improvement Project, Division Cereal Crops and Diseases, Bureau of Plant Industry, U.S. Department of Agriculture Washington, D C.

**J. W. K.—Joseph W. Krutch.** Brander Matthews Professor of Dramatic Literature, Columbia University, New York, N Y. Author of *Samuel Johnson; The Twelve Seasons.*

**J. W. L.—J. W. Luce.** Production Manager, The Fleischmann Distilling Corporation, New York, N.Y.

**J. W. Le.—James W. Lane.** Research Assistant, National Gallery of Art, Washington, D.C. Author of *Masters in Modern Art; Whistler.*

**J. W. M.—John William Moyer.** Staff Taxidermist, Chicago Natural History Museum, Chicago, Ill. Author of *Lessons in Museum Taxidermy.*

**J. W. McB.—James William McBain.** Professor of Chemistry, Stanford University, Stanford, Calif. Author of *Sorption of Gases and Vapours by Solids.*

**J. W. McL.—James Walter McLeod.** Brotherton Professor of Bacteriology, University of Leeds, Leeds, Eng.

**J. W. M. D.—Jesse William Monroe DuMond.** Professor of Physics, California Institute of Technology, Pasadena, Calif., 1946–

**J. W. Mw.—Joseph W. Marlow.** Lawyer Editor and Research Analyst. Military Intelligence Service, U S Department of War, Washington, D C, 1944–46

**J. W. P-H.—John Wyndham Pope-Hennessy.** Deputy Keeper, Department of Sculpture, Victoria and Albert Museum, London Author of *The Drawings of Domenichino at Windsor Castle; Fra Angelico; Giovanni di Paolo; Paolo Uccello; Sassetta*

**J. W. R.—Jackson W. Riddle, M.D.** Associate Professor of Medical Bacteriology and Preventive Medicine, Ohio State University, Columbus, O.

**J. Ws.—Joseph Wells.** Warden of Wadham College, Oxford, 1913–27. Vice-Chancellor, Oxford University, 1923–26 Author of *Oxford and Its Colleges;* etc

**J. W. S.—John Waugh Scott.** Professor of Logic and Philosophy, University College of South Wales and Monmouthshire, Cardiff, 1920–44. Author of *Syndicalism and Philosophical Realism; Kant on the Moral Life;* etc.

**J. W. Sc.—James W. Schade.** Director of Research, B. F. Goodrich Co., Akron, O

**J. W. Sr.—John W. Snyder.** Secretary, U.S. Department of the Treasury, Washington, D C., 1946–53.

**J. W. Ss.—J. W. Severs.** Vice-President, Chicago, Milwaukee, St. Paul and Pacific Railroad Company, Chicago, Ill.

**J. W. T.—John William Tibble.** Professor of Education and Director of the Institute of Education, University College of Leicester, Leicester, Eng Author of *John Clare: A Life; The Letters of John Clare; The Poems of John Clare;* etc.

**J. W. Y.—John W. Young.** Professor of Mathematics, Dartmouth College, Hanover, N.H, 1911–32. Former President of Mathematical Association of America. Author of *Projective Geometry;* etc.

**J. Z.—Joseph Zubin.** Instructor in Psychiatry, Columbia University, New York, N.Y. Associate Research Psychologist, New York State Psychiatric Institute and Hospital, New York, N Y. Co-author of *Handwriting Analysis.*

**K. A. Eck.—Karl August Eckhardt.** Former Professor in the Faculty of Law, University of Göttingen, Germany.

**K. B. M.—Kenneth Ballard Murdock.** Professor of English, Harvard University. Dean of Faculty of Arts and Sciences, 1931–36. Author of *Portraits of Increase Mather;* etc.

**K. B. Mn.—Karl Boyer McEachron.** Former Assistant Works Engineer, General Electric Co., Pittsfield, Mass. Author of *Playing with Lightning.*

**K. B. W.—K. B. Wiklund.** Former Professor of Finno-Ugrian Languages, University of Uppsala, Sweden.

**K. C.—Kent Cooper.** Executive Director, The Associated Press, New York, N.Y. Author of *Barriers Down.*

**K. C. B.—Kenneth Caron Buss.** Air Commodore Head of Middle East Section, Research Department, Foreign Office, London.

**K. C. D. H.—Kenneth Claude Devereux Hickman.** Vice-President in Charge of Research, Distillation Products, Inc., Rochester, N.Y.

**K. C. L.—K. C. Law.** Of the Alliance Assurance Company, Ltd, London.

**K. C. M.—Kenneth Cunningham McGuffie.** Barrister-at-Law and Advocate of the Scottish Bar. Editor of Marsden's *Law of Collisions at Sea.*

**K. C. M. S.—Kenneth Charles Morton Sills.** President Emeritus of Bowdoin College, Brunswick, Me.

**K. Co.—Karl Cohen.** Head of Theoretical Physics Group, Development Division, Standard Oil Develop[illegible]

**K. D. D. H.—K. D. D. Henderson.** Governor of Darfur, Anglo-Egyptian Sudan, 1949– .

**K. E.—Katherine Esau.** Associate Professor of Botany and Associate Botanist, College of Agriculture, University of California.

**K. E. B.—Kenneth E. Boulding.** Associate Professor of Economics, Iowa State College, Ames, Ia. Author of *Economic Analysis;* etc

**K. E. E.—Kenneth Edward Eckenstein.** Consul of Monaco in London.

**K. E. H.—Kenneth Edward Hunt.** University Demonstrator, Oxford University.

**K. Es.—Kathleen Edwards.** Lecturer in Mediaeval History, University of Aberdeen, Aberdeen, Scot. Author of *The English Secular Cathedrals in the Middle Ages.*

**K. F. L.—Katharine Fredrica Lenroot.** Chief, Children's Bureau, United States Federal Security Agency, Washington, D C.

**K. F. M.—Kenneth Fuller Maxcy, M.D.** Professor of Epidemiology, The Johns Hopkins University, Baltimore, Md.

**K. G.—Karl Friedrich Geldner.** Former Professor of Indian Philology, University of Marburg, Germany.

**K. G. J.—Kingsley Garland Jayne.** Sometime Scholar of Wadham College, Oxford. Author of *Vasco da Gama and His Successors.*

**K. Gn.—Kenneth Greisen.** Professor of Physics and Nuclear Studies, Cornell University, Ithaca, N.Y.

**K. G. St.—Kurt G. Stern.** Adjunct Professor of Biochemistry, Polytechnic Institute, Brooklyn, N.Y. Co-author of *General Enzyme Chemistry;* etc.

**K. Hi.—Karl Hildebrand.** President of the Swedish National Debt Board Editor of the Stockholm *Dagblad,* 1904–13. Member of Swedish Parliament, 1907–18.

**K. H. P.—Kirk Harold Porter.** Professor and Head of Department of Political Science, State University of Iowa, Iowa City, Ia. Author of *State Administration;* etc.

**K. I.—Kenneth Ingham.** Senior Lecturer in History, Makerere College, University College of East Africa, Kampala, Uganda.

**K. J. L.—Karl Joseph Leyser.** Tutor in Modern History and Senior Dean of Arts, Magdalen College, Oxford.

**K. K.—K. Krumbacher.** Former Professor of Greek Language and Literature in the University of Munich, Germany.

**K. K. D.—Karl Kelchner Darrow.** Research Physicist, Bell Telephone Laboratories, New York, N Y Author of *Renaissance of Physics;* etc

**K. L.—Karl Loewenstein.** Professor of Political Science and Jurisprudence, Amherst College, Amherst, Mass. Special Assistant to the Attorney General of the United States, 1942–44.

**M. W. J.—Martin Wiggo Johnson.** Professor of Marine Biology, Scripps Institution of Oceanography, University of California, La Jolla, Calif. Co-author of *The Oceans; Their Physics, Chemistry and General Biology.*

**M. W. L. K.—Michael William Lely Kitson.** Lecturer in the History of Art, Department of Fine Arts (Slade School), University College; Visiting Lecturer, Courtauld Institute of Art, University of London.

**M. W. S.—Max W. Salvadori.** Sometime member of the faculty of the University of Geneva, Switzerland, sometime member of the faculty of St. Lawrence University, Canton, N.Y.

**M. W. T.—Morris William Travers.** Emeritus Professor and Fellow in Applied Physical Chemistry in the University of Bristol, England. Director, Indian Institute of Science, 1906–14. Technical Consultant, Ministry of Supply, 1940. Author of *The Liquefaction of Hydrogen;* etc.

**M. W. v. B.—M. W. von Bernewitz.** Formerly with Federal Bureau of Mines. Author of *Cyanide Process, 1910–1913; Handbook for Prospectors.*

**Mx. G.—Max Gluckman.** Professor of Social Anthropology in the University of Manchester, Manchester, Eng. Author of *Economy of the Central Barotse Plain; The Judicial Process Among the Barotse of Northern Rhodesia*

**M. Y.—Mahonri (Mackintosh) Young.** Sculptor, painter and etcher.

**My. S. S.—Mary S. Sherman, M.D.** Associate Professor of Orthopaedic Surgery, Tulane and Ochsner Clinic, New Orleans, La.

**My. W.—Mary Walton.** Chief Assistant, Sheffield City Libraries. Author of *Sheffield: Its Story and Its Achievements.*

**N.—William Richard Morris, 1st Viscount Nuffield.** Chairman of Morris Motors Ltd.

**N. A.—Nels Anderson.** Formerly with Department of Sociology, Columbia University. Author of *The Hobo.*

**Na. Br.—Nathan Brewer, D.V.M.** Research Associate in Physiology (Assistant Professor) and Superintendent of Animal Quarters, Illinois Society for Medical Research, Chicago, Ill.

**N. A. C.—Nelson Antrim Crawford.** Editor in Chief of *The Household Magazine,* Topeka, Kan. Director of Information, U.S. Department of Agriculture, Washington, D.C., 1925–28. Co-author of *Agricultural Journalism.*

**N. A. Cn.—Norman Alexander Cameron, M.D.** Professor of Psychiatry, School of Medicine, Yale University. New Haven, Conn. Author of *Reasoning, Regression and Communication in Schizophrenics.*

**N. Al.—Sir Norman Angell.** Member, Council, Royal Institute of International Affairs, 1928– . Member, House of Commons, England, 1929–31. Awarded Nobel Peace Prize, 1933. Author of *The Great Illusion; Preface to Peace;* etc.

**Na. L.—Nathan Levinson.** Chief Engineer, Warner Bros. Studio, Burbank, Calif. Vice-President, Research Council, Academy of Motion Picture Arts and Sciences, 1942.

**N. A. T.—Nicolas A. Transehe.** Commander, formerly with the Russian Navy. Member of the staff of the American Geographical Society. Author of *Problems of Polar Research;* etc.

**N. B.—Niels Henrik David Bohr.** Director of the Institute of Theoretical Physics at Copenhagen, Denmark. Nobel Prize for Physics, 1922. President, Royal Danish Academy of Science.

**N. B. G.—Norman Bel Geddes.** Scenic artist. Designer of *The Miracle; The School for Scandal;* etc.

**N. B. J.—Norman Brooke Jopson.** Professor of Comparative Philology, Cambridge University, 1937– . Fellow of St. John's College, Cambridge, 1937– . Professor of Comparative Slavonic Philology, University of London, 1936–37. Co-author of *Spoken Russian.*

**N. B. M.—Norman B. McCullough, M.D.** Chief of Clinical Research, National Microbiological Institute, National Institutes of Health, Bethesda, Md.

**N. B. Mr.—Norwood B. Melcher.** Chief, Ferrous Metals and Alloys Branch, Bureau of Mines, U.S. Department of the Interior, Washington, D.C.

**N. Br.—Norton Breton.** Messrs. Henckell du Buisson, London.

**N. C.—Norman Callan.** Reader in English, University of London. Author of *The Poems of Christopher Smart; Poetry in Practice.*

**N. C. R.—Nathan Chamberlain Rockwood.** Editorial Consultant, *Rock Products.* President, Tradepress Publication Corporation, 1931–39. Compiler of *Cumulative Index of Engineering News,* Chicago, Ill., 1910–17.

**N. C. S.—Norman Clemens Schultze.** Technical Representative, Mathieson Chemical Corp., Baltimore, Md.

**N. C. V.—Nina C. Vandewalker.** Specialist in Kindergarten Education, United States Bureau of Education, Washington, D.C. Author of *The Kindergarten in American Education;* etc.

**N. D. G.—Nasser D. Ganjei.** Economic Affairs Officer, United Nations, New York, N.Y.

**N. D. M.—Norris Dewar McWhirter.** Athletics Correspondent, the *Observer,* London. Co-author of *Get to Your Marks.*

**N. E. C.—Norman E. Crump.** City Editor, *The Sunday Times,* London, England. Joint author of *Clare's A.B.C. of the Foreign Exchanges.*

**N. F.—Norman French.** Editor, *The Hardware Trade Journal,* London.

**N. F. B.—Neil Freeborn Beardsley.** Former Assistant Professor of Physics, The University of Chicago.

**N. F. M.—Nevill Francis Mott.** Melville Wills Professor of Theoretical Physics, University of Bristol, England. Co-author of *Electronic Processes in Ionic Crystals;* etc.

**N. G.—Nathan Greene.** Practising lawyer in association with the firm of Cook, Nathan, Lehman and Greenman, New York. Co-author of *The Labour Injunction.*

**N. G. A.—Noel Gilroy Annan.** Fellow of King's College, Cambridge. Author of *Leslie Stephen.*

**N. G. G.—Nicholas George Gedye.** Former Consulting civil engineer. Former Regional Works Adviser to Regional Commissioner for S.W. England.

**N. G. M.—N. G. Mavris, M.D.** President of the Dodecanesian National Council. Author of *The Historical Archives of the Island of Cassos in the Dodecanese;* etc. Editor, *The Greek Dodecanese.*

**N. G. S.—Norman G. Shidle.** Executive Editor, *S.A.E. Journal,* and Automotive Editor, *Forbes,* New York, N.Y.

**N. Gy.—Nicolette Mary Gray.** Author of *Dante Rossetti and Ourselves; XIXth Century Type and Title Pages; Jacob's Ladder.*

**N. H. E.—Nathanael Howard Engle.** Director, Bureau of Business Research, University of Washington, Seattle, Wash Assistant Director, in charge of Research and Statistics, Bureau of Foreign and Domestic Commerce, Department of Commerce, Washington, D.C., 1932–. Author of *Housing Conditions in the United States;* etc.

**N. H. Mc.—Neil Hartley McLean.** Publications Department, the Broken Hill Proprietary Company Limited, Newcastle, Austr.

**N. I. M.—Nicholas Ivan Momtchiloff.** Economic Adviser to the Industrial and Commercial Finance Corporation, London Author of *Ten Years of Controlled Trade in South-Eastern Europe.*

**N. J.—Nathan Jacobson.** Former Associate Professor of Mathematics, The Johns Hopkins University, Baltimore, Md. Author of *The Theory of Rings.*

**N. J. B.—N. J. Berrill.** Professor of Zoology, McGill University, Montreal, Quebec.

**N. J. K.—Nicolaas Johannes Krom.** Former Professor of the History and Archaeology of the East Indies, University of Leyden, Netherlands. Director of the Institute of Indian Archaeology.

**N. J. T.—Rev. Neil J. Twombly, S.J.** Professor of Classics and Director, Department of Classical Humanities, Woodstock College, Woodstock, Md.

**N. K.—Nathaniel Kleitman.** Professor of Physiology, The University of Chicago. Author of *Sleep and Wakefulness;* co-author of *Sleep Characteristics.*

**N. L.—Nathaniel Lloyd.** Former lecturer on architecture. Author of *A History of English Brickwork;* etc.

**N. Le.—Nathan Levi.** Former Assistant Editor of *Die Volkstem,* Pretoria, South Africa.

**N. L. F.—Norman L. Forter.** Translator and archivist to H.M. Legation in Rumania.

**N. L. H.—Nina L. Hills (Hon. Mrs. Eustace Hills).** Chairman of the Council of the National Society of Day Nurseries, England.

**N. L. Hl.—Norman Llewellyn Hill.** Professor of International Law and Relations, University of Nebraska, Lincoln, Neb. Author of *Claims to Territory in International Law and Relations; International Administration.*

**N. M.—Neil Munro.** Author and journalist.

**N. Ma.—Sir Neill Malcolm.** Major General. Served N.W. Frontier, India, South African War and World War I. Editor of *The Science of War.*

**N. M. B.—Nicholas Murray Butler.** President, Columbia University, 1901–45. Nobel Peace Prize, 1931. Author of *The Meaning of Education;* etc.

**N. M. F.—Nevin M. Fenneman.** Former Professor of Geology, University of Cincinnati, O. Author of *Physiography of Western United States;* etc.

**N. M'L.—Norman M'Lean.** Master of Christ's College, Cambridge, 1927–36, and Former University Lecturer in Aramaic.

**N. M. P.—Norman Mosley Penzer.** Author of *Non-Ferrous Metals and Other Minerals;* etc.

**N. N. D.—Nellis Norman Dalton.** Consultant, Association of American Soap and Glycerine Producers.

**N. N. P.—Nicholas N. Poppe.** Professor, University of Washington, Seattle, Wash. Author of *History of the Mongolian Script; The "Square" Alphabet; Uigur-Mongolian grammatik.*

**No. B.—Norman de Mattos Bentwich.** Professor of International Relations, Jerusalem University. Author of *Judaea Lives Again; From Geneva to San Francisco;* etc

**No. Br.—Norman Bauer.** Research Chemist, California Research Corp., Berkeley, Calif.

**N. R.—Nicolai Rubinstein.** Lecturer in History, Westfield College, University of London.

**N. R. E.—Norman Robson Elliott.** Research Student and Demonstrator, King's College, University of Durham, Durham, Eng.

**N. S. A.—Nathaniel S. Apter, M.D.** Head and Associate Professor of Psychiatry, The University of Chicago.

**N. S. B.—Norman Sharpe Buchanan.** Associate Director, Rockefeller Foundation, 1947– . Author of *Economics of Corporate Enterprise; International Investment and Domestic Welfare.*

**N. Sm.—Normand Stulman.** Chief, Applied Physics Section, Engineering and Technical Division, U.S. Army Signal Corps.

**N. S. M.—Norman Stayner Marsh.** Barrister-at-Law. Stowell Fellow in Civil Law and Bursar of University College; Lecturer in Law, Oxford University.

**N. S. T.—Prince N. S. Trubetzkoy.** Former Professor of Slavonic Philology, University of Vienna.

**N. S. Tf.—Nicholas S. Timasheff.** Professor of Sociology, Fordham University, New York, N.Y Author of *Introduction to the Sociology of Law; One Hundred Years of Probation.*

**N. Sy.—Nicolas Slonimsky.** Writer, musician and teacher. Author of *Music Since 1900; Music of Latin America.*

**P. B.—Pierre Bernus.** Former Foreign Editor, the *Journal des Débats.* Former Paris Correspondent, the *Journal de Genève.*

**P. Bd.—Philip Bard.** Professor of Physiology, The Johns Hopkins University, Baltimore, Md.

**P. Be.—Paul Beaujon.** Pen name of Mrs. Beatrice L. Warde. Writer and lecturer on typography. Co-author, *Books American.*

**P. B. F.—Philip B. Fleming.** U S. Ambassador to Costa Rica Former Undersecretary of Commerce for Transportation

**P. B. H.—Paul B. Halstead.** Secretary-Treasurer, The Cotton-Textile Institute, Inc., New York, N.Y.

**P. B. Hn.—Patrick Bruce Hepburn.** Secretary, the Booksellers Association of Great Britain and Ireland.

**P. B. I.—P. B. Ingham.** Director of the London School of Dalcroze Eurhythmics.

**P. B. N.—Pierrepont Burt Noyes.** President, Oneida Ltd., Oneida, N.Y.

**P. B. P.—Pitman Benjamin Potter.** Grozier Professor of International Law, American University, Washington, D.C. Managing Editor of the *American Journal of International Law.* Author of *Introduction to the Study of International Organization;* etc.

**P. B. S.—Paul Bigelow Sears.** Professor of Botany, Oberlin College, Oberlin, O. Author of *Deserts on the March;* etc.

**P. By.—Paul Bellamy.** Editor, the *Cleveland Plain Dealer,* Cleveland, O.

**P. C.—Pierre Champion.** Author of *Procès de condamnation de Jeanne d'Arc;* etc.

**P. C. By.—Paul C. Bucy, M.D.** Professor of Neurology and Neurological Surgery, College of Medicine, University of Illinois, Chicago, Ill Author of *The Precentral Motor Cortex;* co-author of *Neurology.*

**P. C. H.—Paul C. Hodges, M.D.** Professor of Radiology, in charge of the Section of Radiology, The University of Chicago. Co-author of *Diseases of Bones and Joints.*

**P. C. K.—Peter C. Kronfeld, M.D.** Professor of Ophthalmology, College of Medicine, University of Illinois, Chicago, Ill

**P. C. M.—Sir Peter Chalmers Mitchell.** Secretary to the Zoological Society of London, 1903–35. Author of *Outlines of Biology;* etc.

**P. C. Me.—Paul C. Melrose.** Correspondent of *South China Morning Post,* Hong Kong, China, 1921–38.

**P. C. Mf.—Paul Christoph Mangelsdorf.** Professor of Botany and Director of the Botanical Museum, Harvard University. Co-author (with R. G. Reeves) of *The Origin of Indian Corn and Its Relatives.*

**P. C. Y.—Philip Chesney Yorke.** Magdalen College, Oxford.

**P. D. C.—Paul D. Converse.** Professor of Business Organization and Operation, University of Illinois, Urbana, Ill. Author of *Marketing Methods and Policies,* etc.

**P. D. G. H.—Peter Davidson Gunn Hamilton.** Chief Port Engineer, U.S. Naval and Air Force Bases in Spain.

**P. Dh.—Percy Dunsheath.** Member, London Electricity Board. President, Electrical Development Association. Chairman of Convocation, University of London. Author of *A Century of Technology; The Electric Current; The Graduate in Industry.*

**P. D. M.—Patrick Denis Mehigan.** Freelance journalist and author, Dublin, Ire. Author of *History of Hurling; History of Irish Athletics; History of Gaelic Football;* etc.

**P. Ds.—Porphyrios Dikaios.** Curator, Cyprus Museum, Nicosia, Cyprus Author of *Khirokitia; Guide to Cyprus Museum.*

**P. D. T.—Parker Davies Trask.** Geologist, U S Geological Survey, U.S. Department of the Interior.

**P. Du.—Paul Dumas.** Vice-President, Standard Technical Company Member, National Technical Committee Conference Board, American Automobile Association.

**P. Dw.—Philip Drew.** Lecturer in English Literature, Glasgow University, Glasgow, Scot

**P. E. C.—Percy E. Corbett.** Research Associate, Center of International Studies, Princeton University, Princeton, N J. Author of *Law and Society in the Relations of States; Post-War Worlds*

**P. E. Ch.—P. E. Church.** Professor and Executive Officer, Department of Meteorology and Climatology, University of Washington, Seattle, Wash, 1947–

**P. Eg.—Paul Einzig.** Political Correspondent, *The Financial Times,* London England Author of *The Theory of Forward Exchange;* etc

**P. E. G.—Paul Eveleigh Grainger.** Statistician, British Non-Ferrous Metals Federation and British Bureau of Non-Ferrous Metals Statistics, Birmingham, Eng.

**P. E. Jn.—Paul E. Johnston.** Professor of Agricultural Economics, University of Illinois, Urbana, Ill.

**P. E. K.—Paul Ernest Klopsteg.** Professor of Applied Science and Director of Research, Northwestern Technological Institute, Evanston, Ill Author of *Turkish Archery and the Composite Bow.*

**P. E. L.—Peter Edwin Lewis.** Practising Barrister of the Honourable Society of the Inner Temple, London.

**P. E. R.—Peter Edward Russell.** King Alfonso XIII Professor of Spanish Studies, Oxford University. Fellow of Queen's College, Oxford.

**P. F. P.—Rev. Paul F. Palmer, S.J.** Professor of Dogmatic Theology and Lecturer in the History of Penance, Woodstock College, Woodstock, Md.

**P. F. W.—Park F. Wollam.** Former Assistant in History, University of California, Berkeley, Calif.

**P. G.—Percy Perceval Gardner.** Professor of Classical Archaeology, University of Oxford, 1887–1925.

**P. G. B.—Peter Gordon Brown.** Fellow of the Institute of Actuaries. Assistant Actuary, Government Actuary's Department, London.

**P. G. Ds.—P. G. Davies.** Colonel R.A.O.C. Former Secretary, The Croquet Association, London.

**P. Ge.—Pieter Geyl.** Professor of Modern History, University of Utrecht, Utrecht, Netherlands. Professor of Dutch History and Institutions, University of London, 1919–35. Author of *The Revolt of the Netherlands, 1555–1609;* etc.

**P. G. F.—Peter Godfrey Foote.** Lecturer in Old Scandinavian, University College, London.

**P. G. H. B.—Percy George Hammall Boswell.** Emeritus Professor of Geology in the University of London, Imperial College of Science and Technology.

**P. Gi.—Peter Giles.** Vice-Chancellor of Cambridge University, 1919–21, Master of Emmanuel College, Cambridge, and University Reader in Comparative Philology, 1911–35. Author of *The Aryans* (Cambridge History of India)s

**P. G. K.—Paul G. Konody.** Former Art Critic of *The Observer* and *The Daily Mail,* London. Author of *Velasquez, His Life and Work;* etc.

**P. Gm.—Percy Groom.** Professor of the Technology of Woods and Fibres, Imperial College of Science and Technology, 1911–31. Author of *Trees and Their Life Histories;* etc.

**P. Go.—Philip Gosse, M.D.** Author of *The Pirates' Who's Who; The History of Piracy;* etc.

**P. Gr.—Philip Graves.** Former Assistant Foreign Editor of the *Times,* London. Author of *The Land of Three Faiths;* etc.

**P. G. Rs.—Philip George Rogers.** Former Lecturer in German History and Institutions, School of Military Intelligence, British Army of the Rhine.

**P. G.-S.—Rev. P. Gardner-Smith.** Fellow and Dean of Jesus College, Cambridge.

**P. G. Sr.—Paul George Stecher.** Chemist, Research and Development Laboratory, Merck & Co, Inc., Rahway, N.J.

**P. G. T.—Peter Guthrie Tait.** Professor of Natural Philosophy, Edinburgh University, Scotland, 1860–1901.

**P. Gu.—Right Rev. Monsignor Peter Guilday.** Former Professor of American Church History, Catholic University of America, Washington, D C Founder of Catholic Historical Association, 1919. Made Domestic Prelate by Pius XI. Former Editor of *Catholic Historical Review* (founder).

**P. H. H.—Paul H. Holinger, M.D.** Professor of Bronchoesophagology, Department of Otolaryngology, College of Medicine, University of Illinois, Chicago, Ill.

**P. H. J.—Percy Herbert Jones.** General Secretary, the Cremation Society Secretary-General, the International Cremation Federation Author of *Cremation in Great Britain; Pioneers of Cremation.*

**P. H. K.—Peter Henry Karmel.** Professor of Economics, University of Adelaide, Adelaide, Austr.

**P. H. M.-B.—Sir Philip Henry Manson-Bahr, M.D.** Consulting Physician. Hospital for Tropical Diseases and Albert Dock Hospital, London, Eng. Former Director, Clinical Division, London School of Hygiene and Tropical Medicine. Author of *The Dysenteric Disorders;* etc.

**P. H.-My.—Philip Hewitt-Myring.** Public Relations Adviser for the Development and Welfare Organization in the British West Indies.

**P. H. O.—Paul H. Oehser.** Editor, Department of Engineering and Industries, U.S. National Museum, Washington, D.C.

**P. H. O. R.—P. H. Otto Reinmuth.** Research Fellow in Chemistry, The University of Chicago.

**P. H. P.-S.—Philip Henry Pye-Smith.** Former Consulting Physician to Guy's Hospital, London, and Vice-Chancellor of the University of London. Co-author of *A Text Book of Medicine;* etc.

**P. Hu.—Prevost Hubbard.** Chemical Engineer, The Asphalt Institute, New York, N.Y. Author of *Dust Preventives and Road Binders;* etc.

**P. H. W.—Sir Percy Henry Winfield.** Rouse Ball Professor of English Law, Cambridge University 1928–43. Former Editor in Chief, *Cambridge Law Journal.*

**P. I. D.—Philipp Ignaz Dengel.** Former Professor of Modern History in the University of Innsbruck, Austria Director of the Austrian Institute of History in Rome.

**R. G. A. de B.—Reginald George Arthur de Bray.** Lecturer in Comparative Slavonic Philology, School of Slavonic and East European Studies, University of London Author of *Guide to the Slavonic Languages.*

**R. G. D. A.—Roy George Douglas Allen.** Professor of Statistics, University of London Author of *Statistics for Economists.*

**R. G. H.—Ralph George Hawtrey.** Assistant Secretary to the Treasury, London. Author of *Currency and Credit;* etc.

**R. G. Hu.—Ray Garland Hulburt.** Director of Information and Statistics, American Osteopathic Association, 1924–47. Former Editor of *The Journal of the American Osteopathic Association*

**R. Gi.—Sir Robert Giffen.** Former Assistant Editor, with Walter Bagehot, of the *Economist.* [illegible] (1892–97) to the British [illegible] Author of *Essays on Finance;* etc.

**R. Git.—Roy Gittinger.** Regents' Professor of History, 1946– . Dean of Administration, 1926–41, Dean of Admission, 1941–46, University of Oklahoma, Norman, Okla. Author of *The Formation of the State of Oklahoma;* etc.

**R. Gl.—Ralf Gall.** Former Assistant Financial Editor, *Chicago Daily News.*

**R. G. O.—Ralph G. Owens.** Dean of Engineering, [illegible] of Technology, Chicago, Ill.

**R. G. P.—Ralph G. Peterson.** Public Relations Consultant.

**R. G. Rr.—Robert George Raymer.** Former Associate Professor of History, University of Redlands, Redlands, Calif. Author of *Montana, the Land and the People.*

**R. G. S.—Robert Gordon Sproul.** President, University of California, Berkeley, Calif.

**R. G. Se.—Robert Granville Stone.** Meteorologist, Headquarters, Air Weather Service (A A F) Editor, *Bulletin of the American Meteorological Society.* Author of *Meteorology of the Virgin Islands;* etc.

**R. G. Sr.—Ralph G. Sanger.** Professor and Head of the Department of Mathematics, Kansas State College, Manhattan, Kansas. Author of *Synthetic Projective Geometry*

**R. Gt.—Raleigh Gilchrist.** Senior Chemist, National Bureau of Standards, U.S Department of Commerce, Washington, D.C.

**R. H. Bt.—Ralph Henry Bassett.** Retired Permanent Secretary, Ministry of Industries and Fisheries, Ceylon Government Author of *The Rare Romances of Nari ya the Jackal, Romantic Ceylon.*

**R. H. C.—Sir Reginald Henry Craddock.** Member of the Royal Commission on the Civil Services of India, 1923–24. Lieutenant-Governor of Burma, 1917–22.

**R. H. Ch.—Robert Henry Charles, D.D.** Former Archdeacon of Westminster Former Fellow of Merton College, Grinfield Lecturer and Lecturer in Biblical Studies, Oxford. Author of *Lectures on the Apocalypse; Studies in the Apocalypse;* etc.

**R. H. D.—Sir Robert H. Davis.** Governing Director of Siebe, Gorman & Co., Ltd, submarine engineers, London Author of *Deep Diving and Submarine Operations;* etc.

**R. He.—Richard Hesse.** Professor of Zoology and Director Zoological Institute in the University of Berlin, 1926–36.

**R. H. E.—Robert H. Ebert, M.D.** Chief of Division of Pulmonary Diseases, Billings Hospital, The University of Chicago.

**R. H. Fe.—Ralph Holmes Ferguson.** In charge of the Physical Chemical Research Laboratory, Procter and Gamble Co.

**R. H. Fg.—Richard Howell Fleming.** Assistant Prof[illegible] of Oceanography, Scripps Institute of [illegible] a, Calif Co-author of *The Oceans; Their Physics, Chemistry, and General Biology.*

**R. H. Ga.—Ralph Henry Gabriel.** Professor of History, Yale University. Author of *The Evolution of Long Island;* etc Editor, *Christianity and Modern Thought;* etc.

**R. H. Gr.—R. H. Gretton.** Lecturer in Modern History, Oxford University.

**R. H. L.—Robin Humphrey Legge.** Music Critic for *The Daily Telegraph,* London, 1908–31. Author of *Annals of the Norwich Festivals;* etc

**R. H. Le.—Richard Henry Leigh.** Admiral, United States Navy. Former Chief of Bureau of Navigation, Washington, D.C.; Commander in Chief, U.S. Fleet.

**R. H. Lo.—Robert Harry Lowie.** Professor of Anthropology, University of California, Berkeley, Calif. Former President, American Anthropological Association. Author of *Introduction to Cultural Anthropology; The History of Ethnological Theory;* etc.

**R. H. Mr.—Ralph Hermon Major, M.D.** Professor of Medicine, University of Kansas School of Medicine, Kansas City, Kan. Author of *Physical Diagnosis and Classic Descriptions of Disease.*

**Rh. P.—Ralph Pemberton, M.D.** Professor of Medicine, Graduate School of Medicine, University of Pennsylvania, Philadelphia, Pa Author of *Arthritis and Rheumatoid Conditions;* co-author of *Medical and Orthopaedic Management of Chronic Arthritis.*

**R. H. P.—Rupert Howard Porter.** Seed Technologist, American International Association, Rio de Janeiro, Brazil, 1947– . Professor of Botany, Research Professor of Agronomy and Director of Seed Laboratory, Iowa State College, Ames, Iowa, 1932–46.

**R. H. Q.—Rev. Robert Hebert Quick.** Former Lecturer on Education, Cambridge University. Author of *Essays on Educational Reformers.*

**R. H. R.—Sir (R.) Henry Rew.** Chairman, Inter-[illegible] Committee on Unemployment Insurance in Agriculture, 1925–26. Board of Agriculture and Fisheries, 1898, Assistant Secretary, 1906–18. Secretary to the Ministry of Food, 1916–17 -Author of *A Primer of Agricultural Economics;* etc

**R. H. Ra.—Robert Heron Rastall.** Attached to War Office, 1915–19 Author of *Geology of the Metalliferous Deposits; Physico-Chemical Geology* Co-author of *Textbook of Geology and Petrology of Sedimentary Rocks;* etc Former Editor of the *Geological Magazine.*

**R. H. Rn.—Robert Henry Ralston.** Research Chemist, Hercules Powder Co, Wilmington, Del

**R. H. Rs.—Ray Harland Roberts.** Professor of Horticulture, University of Wisconsin, Madison, Wis

**R. H. S.—Richard Haviland Smythe.** Architect.

**Rh. S. C.—Ruth Shonle Cavan.** Associate Professor of Sociology, Rockford College, Rockford, Ill. Author of *American Family; Criminology; Suicide.*

**R. H. Sh.—Robert Hale Shields.** Assistant in History, University of California, Berkeley, Calif

**R. Hu.—Sir Robert Hunter.** Author of *The Preservation of Open Spaces and of Footpaths and Other Rights of Way.*

**R. H. W.—Robert Hendry Weir.** Assistant Director, Directorate of Engine Research and Development, Ministry of Supply, London

**R. H. Y.—Richard Hugh Young.** Assistant Public Relations Adviser, Development and Welfare Organization in the West Indies

**R. I.—Roger Ingpen.** Editor of *Letters of [illegible] Shelley; A Selection of Shelley's [illegible] Regent Library.* Co-editor of Julian Edition of Shelley's complete works.

**R. I. P.—Reginald Innes Pocock.** Temporary Assistant in the Zoological Department of the British Museum, London, 1923–47, and former Natural History Editor of *The Field.* Author of *Arachnida of British India and Mammalia of British India,* Vol. I, II.

**R. I. T.—Robert I. Tenney.** President, Wahl-Henius Institute, Chicago, Ill.

**R. Ja.—Roland Godfrey Janson.** New York, N.Y.

**R. J. Be.—Ralph J. Bunche.** Director, Department of Trusteeship and Information from Non-Self-Governing Territories, United Nations; Acting U.N. Mediator on Palestine, 1948–49. Nobel Prize for Peace, 1950.

**R. J. C.—Robert Jesse Charleston.** Assistant Keeper, Department of Ceramics, Victoria and Albert Museum, London.

**R. J. C. A.—Richard John Copland Atkinson.** Lecturer in Prehistoric Archaeology, University of Edinburgh. Edinburgh, Scot. Author of *Field Archaeology.*

**R. J. G.—Reginald John Gladstone, M.D.** Former Reader in Anatomy and Lecturer in Embryology, King's College, University of London.

**R. J. H. K.—Robert John Herman Kiphuth.** Professor of Physical Education and Head Coach of Swimming, Yale University, New Haven, Conn. United States Olympic Coach, 1928, 1932, 1936, 1940, 1948. Author of *Swimming;* co-author of *Basic Swimming*

**R. J. J.—Richard J. Jones, M.D.** Assistant Professor of Medicine, Department of Medicine, The University of Chicago.

**R. J. K.—Raymond John Kelly.** National Commander, The American Legion, 1939–40

**R. J. Mi.—R. J. Milbourne.** Member of the Council and Chairman (1928–29) of the Society of British Gas Industries Author of *Gasholder Design and Construction*

**R. J. Mr.—Robert J. Maurer.** Associate Professor of Physics, Carnegie Institute of Technology, Pittsburgh, Pa.

**R. Jn.—Raymond Johnson.** Sports Editor, *The Nashville Tennessean,* Nashville, Tenn President, Amateur Softball Association of America.

**R. J. Sn.—R. J. Stephenson.** Professor and Head of the Department of Physics, College of Wooster, [illegible] Author of *Exploring in Physics; Mechanics and Properties of Matter.*

**R. J. T.—Richard John Tabor.** Retired Assistant Professor of Botany, Imperial College of Science and Technology, University of London.

**R. J. Tr.—Robert Julius Trumpler.** Professor of Astronomy, University of California, Berkeley, Calif.

**R. K.—Rollin Kirby.** Former Cartoonist, *Look Magazine* Political Cartoonist, the *New York Post,* 1939–42.

**R. K. B.—Ralph Klaus Blumenau.** Assistant Master at the King's School, Canterbury, Eng.

**R. K. D.—Sir Robert Kennaway Douglas.** Former Keeper of Oriental Printed Books and MSS. at the British Museum, London, and Professor of Chinese, King's College, London. Author of *The Language and Literature of China;* etc.

**R. Ke.—Rudolf Kingslake.** Head of Optical Design Department, Eastman Kodak Co., Rochester, N.Y.

**R. K. E.—Richard Kempton Estelow.** Research Chemist, Columbian Carbon Company, Brooklyn, N.Y.

**R. K. G.—Ralph Kalb Ghormley, M.D.** Professor in Orthopaedic Surgery, Mayo Foundation, and Head of Orthopaedic Section, Mayo Clinic, Rochester, Minn. Co-author of *Diagnosis in Joint Disease.*

**R. L. A.—Sir Reginald Laurence Antrobus.** Member of Central Board of Finance of Church of England, 1925–35, and National Assembly, 1920–25. Governor of St. Helena, 1889–90.

**R. L. Be.—Richard L. Beyer.** Department of History, State University of Iowa, Iowa City, Ia.

**R. Ld.—Robert Lynd.** Formerly on staff of the *News Chronicle,* London. Author of *Books and Authors;* etc.

**R. L. E.—Richard L. Evans.** Editor, writer, church official. Author of *At This Same Hour; The Spoken Word; This Day and Always; Tonic for Our Times; Unto the Hills.*

**R. Lev.—Reuben Levy.** Lecturer in Persian, Cambridge University.

**R. L. F.—Rachel Louise Fitch.** Dean of Women, Cornell University, Ithaca, N.Y., 1926–41.

**R. L. H.—Richard Lionel Hippisley.** Colonel. Formerly employed in the Trigonometrical Survey of Cyprus. Deputy Director, Army Signals, Central Force, 1914–16.

**R. L. Ha.—Robert Lee Hale.** Professor of Law, Columbia University. Author of *Valuation and Rate Making;* etc.

**R. L. Ho.—Robert Lockhart Hobson.** Former Keeper of Department of Oriental Antiquities and Ethnography, British Museum, London. Author of *Worcester Porcelain, Chinese Pottery and Porcelain,* etc

**R. L. Ht.—R. L. Hallett.** Former Chief Chemist, National Lead Company, New York, N.Y Author of Paint Industry Section of *Representative Industries in the United States;* etc

**R. L. M.—Rodolphe Louis Mégroz.** Author of *Gabriel Rosetti; Profile Art Through the Ages.*

**R. L. Ne.—R. L. Neyman.** Commander, U S Navy Bureau of Ordnance, U S Department of the Navy, Washington, D C

**Rl. P.—Raphael Powell.** Reader in Law, University of London. Author of *The Law of Agency;* etc.

**R. L. P.—Reginald Lane Poole.** Former Honorary Fellow of Magdalen College, Oxford. Lecturer in Diplomatics in the University, 1896–1927. Keeper of the University Archives, 1909–27. Curator of the Bodleian Library, 1914–26. Author of *Wycliffe and Movements for Reform.*

**R. L. Pn.—Robert L. Pendleton.** Principal Soil Technologist, Office of Foreign Agricultural Relations, U.S. Department of Agriculture, Washington, D C. 1942–

**R. L. S.—Robert Louis Stevenson.** Former novelist, essayist and poet. Author of *Kidnapped; Treasure Island;* etc.

**R. L. S.-R.—Reginald Leslie Smith-Rose.** Director, Radio Research, Department of Scientific and Industrial Research [illegible]

**R. L. T.—Ralph Lilley Turner.** Director, School of Oriental and African Studies; Professor of Sanskrit, University of London. Author of *Gujarati Phonology;* etc.

**R. L. Te.—Robert L. Thorndike.** Professor of Education, Teachers College, Columbia University, New York, N.Y. Author of *Personnel Selection.*

**R. L. W.—Ray Lyman Wilbur, M.D.** Former Chancellor of Stanford University, Stanford, Calif Former Secretary of the Interior, Washington, D C.

**R. L. Wi.—Raymond Louis Wilder.** Research Professor of Mathematics, University of Michigan, Ann Arbor, Mich. Former Research Worker, Institute for Advanced Study.

**R. L. Wl.—Rupert L. Wenzel.** Assistant Curator of Insects, Chicago Natural History Museum, Chicago, Ill.

**R. Ly.—Richard Lydekker.** Member of staff of Geological Survey of India, 1874–82. Author of *Catalogues of Fossil Mammals, Reptiles and Birds in British Museum;* etc.

**R. Ma.—Robert Mackintosh, D.D.** Professor at Lancashire Independent College and Lecturer in the University of Manchester, England, 1904–30 Author of *Essays Towards a New Theology; First Primer of Apologetics;* etc.

**R. M. A.—Rudolph M. Anderson.** Chief of Division of Biology, National Museum of Canada, Ottawa, 1920–46. Author of *Birds of Iowa.*

**R. MacD.—Robert MacDonald, Jr.** Vice-President and Director, General Abrasive Company, Inc, Niagara Falls, N.Y.

**R. M. B.—Richard Milton Bozorth.** Research Physicist, Bell Telephone Laboratories, Murray Hill, N.J.

**R. McK.—Roderick MacKenzie.** Former Fereday Fellow of St John's College, Oxford, and Assistant Editor of the 9th edition of Liddell and Scott's *Greek-English Lexicon.*

**R. M. F.—R. M. Fleming.** Librarian, The Geographical Association, Aberystwyth. Author of *Ancient Tales from Many Lands;* etc.

**R. M. Fo.—Raymond Michael Foley.** Former Administrator, Housing and Home Finance Agency, Washington, D C.

**R. M. H.—Ronald Martin Howe.** Deputy Commissioner of Police, Scotland Yard. Author of *Criminal Investigation, Adapted From Hans Gross.*

**R. M. He.—Robert Mitchell Henry.** Professor of Humanity, St Andrews University, Scotland Honorary Professor of Classical Literature, Trinity College, Dublin. Professor of Latin, 1907–38.

**R. M. Hu.—Rowland M. Hussey.** Superintendent, Wire Department, Jones & Laughlin Steel Corporation, Pittsburgh, Pa.

**R. M. J. L.—Robert Maurice Jean Lemoir.** Technical Director, Smith's English Clocks, Ltd., London.

**R. M. L.—Russell Mortimer Luckock.** Major General Commander, 54th Division, T A., 1934–38. Former Commandant, Small Arms Schools, India, and O.C. 163rd Infantry Brigade, Territorial Army, 1926–28 Brigadier, General Staff, Southern Command, Salisbury, 1928–32.

**R. M. Le.—Robert MacDonald Lester.** Secretary, Carnegie Corporation of New York, N.Y. Author of *Forty Years of Carnegie Giving;* etc.

**R. M. O.—Robert M. Ormerod.** Director of John Ormerod and Sons, Ltd., manufacturers of leather belting, etc.

**R. Mr.—Roland Émile Mousnier.** Professor of Modern History in the Faculty of Letters, University of Strasbourg, Strasbourg, Fr. Author of *La Vénalité des offices sous Henri IV et Louis XIII; Le XVIIIe Siècle, révolution intellectuelle, technique, politique.*

**R. M. R.—R. Marion Robb.** Research Group Leader, E. I. du Pont de Nemours & Company, Inc., Wilmington, Del.

**R. M. T.—R. M. Tryon.** Chemical Warfare Development Laboratory of the Massachusetts Institute of Technology.

**R. Mu.—Ramsay Muir.** Former Lecturer in Modern History at Owens College, Manchester, England

**R. M. W.—Robert Mark Wenley.** Former Professor of Philosophy in the University of Michigan, Ann Arbor, Mich.

**R. M. Wn.—Richard Middlewood Wilson.** Head of the Department of English Language, University of Sheffield, Sheffield, Eng. Author of *Early Middle English Literature; The Lost Literature of Medieval England.*

**R. M. Wr.—Russell M. Wilder, M.D.** Director, National Institute of Arthritis and Metabolic Diseases, Bethesda, Md. Former Professor and Chief of the Department of Medicine, Mayo Foundation for Medical Education and Research, Rochester, Minn. Author of *Clinical Diabetes Mellitus and Hyperinsulinism; A Primer for Diabetic Patients.*

**R. My.—Raymond Massey.** Actor of the stage, screen and radio; director and producer in the theatre.

**R. N. B.—Robert Nisbet Bain.** Assistant Librarian, British Museum, London, 1883–1909. Author of *Scandinavia The Political History of Denmark, Norway and Sweden, 1513–1900, Slavonic Europe. The Political History of Poland and Russia from 1469 to 1796;* etc.

**R. N. Ba.—Robert Nesham Bax.** Admiral, R N (retired) Director of the Mobilization Department at the Admiralty, 1924–26. Naval A D C to the King, 1922–23

**R. N. C.—Ram Nath Chopra, M.D.** Director, Drug Research Laboratory, Jammu and Kashmir, India. Author of *Anthelmentics and Their Uses in Medical and Veterinary Practice; Indigenous Drugs of India; Poisonous Plants of India; Tropical Therapeutics.*

**R. Ne.—Ragnar Nurkse.** Professor of Economics, Columbia University, 1947– . Member, Economic, Financial and Transit Department League of Nations, 1934–45. Author of *Internationale Kapitalbewegungen.*

**R. N. L.—Richard N. Larkin.** Bureau Manager, *Business Week,* Pittsburgh, Pa.

**R. Nm.—Rodney Needham.** Research worker, Institute of Social Anthropology, Oxford University.

**R. N. R.-B.—R. N. Rudmose-Brown.** Emeritus Professor of Geography, University of Sheffield, England. Member of the Scottish National Antarctic Expedition 1902–04, and of the Scottish Arctic Expeditions 1909, 1914 and 1919 Author of *Spitsbergen.*

**R. N. S.—R. Norris Shreve.** Professor of Chemical Engineering, Purdue University, Lafayette, Ind Author of *Chemical Process Industries; Selected Process Industries; Dyes Classified by Intermediates;* etc.

**R. N. W.—Ralph Nicholson Wornum.** Keeper of the National Gallery, London, 1854–77 Author of *The Epochs of Painting;* etc.

**Ro. F.—Robert Ferber.** Research Associate Professor, Bureau of Economic and Business Research, Department of Economics, University of Illinois, Urbana, Ill Author of *Statistical Techniques in Market Research.*

**Ro. P. Be.—Roland P. Blake.** Principal Safety Engineer, United States Department of Labour. Author of *Industrial Safety*

**R. P.—René Poupardin.** Secretary of the École des Chartes; Honorary Librarian at the Bibliothèque Nationale, Paris.

**R. Pa.—Sir Richard Arthur Surtees Paget.** Assistant Secretary, Admiralty Board of Invention and Research, 1915–18.

**R. Par.—Raymond Parmer.** Of the firm of Kirlin, Campbell, Hickox and Keating, lawyers, New York, N.Y.

**R. P. B.—Rudolf P. Berle.** Former law secretary to the Justices of the Massachusetts Supreme Judicial Court.

**R. P. Br.—Ralph Paul Bieber.** Professor of History, Washington University, St Louis, Mo. Author of *The Lords of Trade and Plantations.*

**R. P. Bs.—Robert P. Brooks.** Dean of Faculties, 1945– , and Director, Institute of Public Affairs, University of Georgia, Athens, Ga. Author of *A History of Georgia; The Agrarian Revolution in Georgia.*

**R. P. C.—Robert Pierce Casey.** Professor and Head of Department of Biblical Literature and History of Religion, Brown University, Providence, R.I., 1934–50.

**R. P. Co.—Richard Pope Cowl.** Former Professor of English at Bristol University, England Author of *Poetic Theory in England, Text of Henry the Fourth, Pts I and II* in Arderne Shakespeare

**R. Pe.—Robert Peele.** Former Professor of Mining Engineering, School of Mines, Columbia University, Author of *Mining Engineers' Handbook; Compressed Air Plant,* 5th edition

**R. P. F.—Roland Post Falkner.** Statistician, Research Staff, National Industrial Conference Board, 1926–40 Assistant Director of the Census, 1911–12.

**R. P. G.—Robert P. Geyer.** Assistant Professor of Nutrition, Harvard School of Public Health, Boston, Mass

**R. P. H.—Raymond Prunty Holland.** President, American Game Protective Association. Editor of *Field and Stream,* 1924–41 Writer of shooting stories under the name of "Bob White."

**R. Pl.—Raymond Pearl.** Professor of Biology, 1923–40, and Director, Institute of Biological Research, 1925–30, The Johns Hopkins University, Baltimore, Md

**R. P. McC.—Richard P. McCormick.** Associate Professor of History, Rutgers University, New Brunswick, N.J. Author of *Experiment in Independence: New Jersey in the Critical Period, 1781–1789.*

**R. Pn.—Ralph Pearson.** Etcher and designer Author of *Prints of the Year;* etc

**R. Pr.—Robert Priebsch.** Professor of German Language and Literature in the University of London, 1902–31 Author of *Deutsche Handschriften in England;* etc.

**R. P. S.—Ralph Pray Seward.** Associate Professor of Chemistry, The Pennsylvania State College, State College, Pa

**R. P. Sp.—Robert Phillip Sharp.** Professor of Geology, California Institute of Technology, Pasadena, Calif.

**R. R.—Sir Richard Augustine Studdert Redmayne.** Member, Past President of Institute of Mining and Metallurgy; Honorary Member, Surveyors' Institute, H M Chief Inspector of Mines, 1908–20. Author of *The British Coal Industry During the War;* etc.

**Rr. C. An.—Roger Charles Anderson.** Author of *The Rigging of Ships, 1600–1720; The Sailing Ship.*

**R. Rd.—Robert Redfield.** Professor of Anthropology and Dean, Division of the Social Sciences, The University of Chicago. Author of *Tepoztlan, a Mexican Village; Chan Kom, a Maya Village; The Folk Culture of Yucatan.*

**R. Re.—Raymond Régamey.** Artist and designer. Author of *Gericault.*

**R. R. E.—Richard R. Ely.** Chief, Division of Philippine Affairs, U S. Department of State, Washington, D.C

**R. Ret.—Robert Retzer.** Director, Life Insurance Training Course, School of Commerce, Accounts and Finance, New York University, New York, N.Y., 1928–29.

**R. R. G.—Roy R. Grinker, M.D.** Chairman, Department of Neuropsychiatry, Michael Reese Hospital, Chicago, Ill. Author of *Neurology; Men Under Stress.*

**R. R. L.—Robert R. Linton, M.D.** Assistant Clinical Professor of Surgery, Harvard Medical School, Cambridge, Mass.

**R. R. M.—Robert Ranulph Marett.** Rector of Exeter College, Oxford, 1928–43. Former University Reader in Social Anthropology. Editor of *Anthropology and the Classics.* Author of *Anthropology; Psychology and Folklore;* etc.

**R. Rob.—Sir Robert Robinson.** Waynflete Professor of Chemistry, Oxford University, 1930– . Nobel Prize for Chemistry, 1947.

**R. R. P.—Raye R. Platt.** Head of Department of Hispanic American Research, American Geographical Society of New York.

**R. R. R.—Raymond Ronald Ridgway.** Former Associate Director of Research, Norton Company, Worcester, Mass., and Niagara Falls, Ont.

**R. Rs.—R. Ross.** Ministry of Agriculture and Fisheries, London.

**R. R. Sh.—Robert Ross Smith.** Historian, Pacific Section, Office of the Chief of Military History, U.S Department of the Army, Washington, D.C.

**R. Rt.—Reinhold Rost.** Editor of Wilson's *Essays on the Religions of the Hindus;* Hodgson's *Essays on Indian Subjects.*

**R. R. Th.—Reuben R. Thompson.** Editor, *Tobacco.*

**R. R. V.—Richard Rockhill Vogt.** Professor of Chemistry, University of Notre Dame, Notre Dame, Ind. Co-author of *The Chemistry of Acetylene.*

**R. R. W.—Russell Randolph Waesche.** Admiral, U S N. Former Commandant, United States Coast Guard

**R. Ry.—Robert Ridgway.** Former Chief Engineer, Board of Transportation, New York, N Y

**R. S.—Richard Seligman.** Sometime Chief Chemist to the British Aluminium Co., Ltd., London. Technical Managing Director of the Aluminium Plant and Vessel Company, Limited, London.

**R. S. Ba.—Ralph Samuel Bates.** Instructor in English and History, Massachusetts Institute of Technology, Cambridge, Mass. Author of *Scientific Societies in the United States.*

**R. S. C.—Rev. Richard Seymour Cripps.** Vicar of Horningsea, Cambs, Eng.

**R. Sch.—Robert Schmidt.** Former Director, Schlossmuseum, Berlin Author of *Brandenburgische Gläser; Das Glas; Mobel;* etc.

**R. S. Cl.—Reginald S. Clay.** President of the Royal Microscopical Society, 1937–38. Principal, Northern Polytechnic Holloway, London, 1902–31. Author of *Practical Exercises in Light;* etc.

**R. S. Cn.—Ronald Stephenson Cogdon.** Engineer, River Wear Commissioners, Sunderland, Eng.

**R. S. Co.—Robert Seymour Conway.** Former Professor of Latin and Indo-European Philology in the University of Manchester, England

**R. S. Cy.—Robert S. Casey.** Chief Chemist, W. A. Sheaffer Pen Company, Fort Madison, Ia.

**R. Sh.—Ralph Spaeth, M.D.** Assistant Professor of Pediatrics University of Illinois College of Medicine, Chicago, Ill.

**R. S. H.—Robert Selph Henry.** Vice-President, Association of American Railroads. Author of *This Fascinating Railroad Business; Portraits of the Iron Horse.*

**R. S. L.—Robert Strong Lewis.** Professor of Mining, University of Utah, Salt Lake City, Utah Author of section on Boring, *Peele's Mining Engineers' Handbook; Elements of Mining.*

**R. Sm.—Reed Smoot.** Former Senator from Utah and member of the World War I Foreign Debt Commission.

**R. S. M.—R. S. Morrell.** Research Chemist, Mander Bros., Ltd, Wolverhampton, England.

**R. S. Me.—Richard Stetson Morse.** President and Director of Research, National Research Corporation, Boston, Mass

**R. S. Mn.—Robert Swain Morison, M.D.** Assistant Director for the Medical Sciences, the Rockefeller Foundation, New York, N.Y. Former Assistant Professor of Anatomy, Harvard Medical School.

**R. S. P.—Reginald Stuart Poole.** Former Keeper of the Department of Coins and Medals, British Museum, London.

**R. S. Pa.—Richard S. Patterson.** Assistant to the Editor of the Treaties, Department of State, Washington, D.C.

**R. S. Pn.—Sir Ralph Sneyd Pearson.** Director, Forest Product Research Laboratories, Department of Scientific and Industrial Research, Princes Risborough, Bucks., England, 1925–33.

**R. S. R.—Sir Robert Sangster Rait.** Principal and Vice-Chancellor of the University of Glasgow, Scotland, 1929–36

**R. S. S.—Robert Sidney Smith.** Associate Professor of Economics, Duke University, Durham, N.C. Author of *The Spanish Guild Merchant;* etc.

**R. S. Sh.—Raymond Stratton Smith.** Chief of State Soil Survey and Emeritus Professor of Soil Physics, University of Illinois, Urbana, Ill.

**R. S. Sr.—Russell Scott Stauffer.** Assistant Professor of Soil Physics, University of Illinois, Urbana, Ill.

**R. S. T.—Robert S. Thomas.** Military Historian, Historical Section, Army War College, Washington, D.C.

**R. Su.—Ronald Sutcliffe.** Principal Officer, British Government Chemist's Department, London.

**R. T.—Royall Tyler.** Author of *Byzantine Art;* etc.

**R. Ta.—R. Taylor.** Assistant, Chemical Research Laboratory, Teddington, Middlesex, England.

**R. Tay.—Richard Taylor.** U.S. cartoonist. Contributor to *The New Yorker* magazine, 1935–

**R. T. B. F.—Roger Thomas Baldwin Fulford.** Co-editor of *The Greville Memoirs;* author of *The Prince Consort; Queen Victoria; Royal Dukes*

**R. T. D.—Reginald Trevor Davies.** University Lecturer in Spanish History, Oxford University Tutor of St. Catherine's Society, Oxford Author of *Four Centuries of Witch-belief; The Golden Century of Spain.*

**R. T. F.—Russell Todd Fisher.** Former President, National Association of Cotton Manufacturers, Boston, Mass.

**R. T. G.—Robert Theodore Gunther.** Former Tutor in Natural Science and Librarian of Magdalen College, Oxford, Curator of the Lewis Evans Collection of Scientific Instruments, Oxford, 1924. Author of *Early Science in Oxford;* etc.

**R. T. Gl.—Sir Richard Tetley Glazebrook.** Former Fellow of Trinity College, Cambridge, and Chairman Aeronautical Research Committee. Director of the National Physical Laboratory, 1899–1919 Zaharoff Professor of Aviation and Director of the Department of Aeronautics, Imperial College of Science and Technology, University of London, 1920–23. Editor of *Dictionary of Applied Physics.*

**R. T. Go.—Rupert Thomas Gould.** Lieutenant Commander, R N. Former member of the British Horological Institute Author of *The Marine Chronometer: its History and Development;* etc

**R. T. J.—Robert Thomas Jenkins.** Emeritus Professor of Welsh History, University College of North Wales, Bangor, Wales. Author of *The Moravian Brethren in North Wales.* Editor of the Cymmrodorion *Dictionary of Welsh Biography.*

**R. T. McK.—Robert Tait McKenzie, M.D.** Former Research Professor of Physical Education, University of Pennsylvania, Philadelphia, Pa Author of *Exercise in Education and Medicine;* etc.

**Rt. P.—Robert Price.** Professor of Language and Literature, Otterbein College, Westerville, O. Co-author of *Johnny Appleseed: A Voice in the Wilderness.*

**R. T. P.—Roger Tory Peterson.** Author of *Field Guide to the Birds; Junior Book of Birds;* etc. Co-author of *The Audubon Guide to Attracting Birds.*

**R. Tu.—Ray Tucker.** Washington Columnist, "The National Whirligig," McClure Newspaper Syndicate, New York, N Y. Author of *Mirrors of 1932; Sons of the Wild Jackass.*

**R. T. W.—Robert T. Williams.** Specialist in Printing and Lithography, Carrier Engineering Corporation, Newark, N J. Author of *Manufactured Weather in the Printing and Lithographic Industries.*

**R. T. Wa.—Ralph Thomas Walker.** Architect Voorhees, Walker, Foley and Smith, New York, N Y.

**R. Uf.—Ruth Updegraff.** Professor of Preschool Education, Iowa Child Welfare Research Station, State University of Iowa, Iowa City, Ia Author of *Practice in Preschool Education; Studies in Preschool Education.*

**Ru. H.—Rupert Hughes.** Author of *George Washington;* etc.

**R. U. S.—R. U. Sayce.** Lecturer in Material Culture and Physical Anthropology, Cambridge University. Former Lecturer in Geology and Geography Natal University College, Pietermaritzburg, Natal.

**R. van O.—R. van Overstraeten.** Major Member of the Order of Leopold and of the Legion of Honour. Former Aide-de-Camp to His Majesty the King of the Belgians.

**R. von H.-G.—Robert von Heine-Geldern.** Research Associate, The American Museum of Natural History, New York, N Y. Former Professor of Anthropology, University of Vienna Author of *The Archaeology and Art of Sumatra;* etc

**R. V. S.—Sir Richard Vynne Southwell.** Rector of Imperial College of Science and Technology, University of London. In charge of Non-Rigid Airships Design at Royal Navy Air Station, Kingsnorth, 1915–18, and of Aerodynamic and Structural Experiments at the Royal Aircraft Establishment, Farnborough, 1918–19. Professor of Engineering Science, 1929–42, and Honorary Fellow of Brasenose College, Oxford.

**R. V. W.—Ralph Vaughan Williams.** Author of *National Music*

**R. V. Wd.—Ralph V. Wakefield.** Assistant Sales Manager, Equitable Powder Manufacturing Company, Olin Industries, Inc, East Alton, Ill.

**R. W. B.—Robert Wilbur Burgess.** Statistician and economist, Western Electric Co Author of *Introduction to the Mathematics of Statistics.*

**T. F. C.—Theodore Freylinghuysen Collier.** Emeritus Professor of History and International Relations and Head of the History Department, 1917–39, Brown University, Providence, R.I.

**T. F. H.—Talbot Faulkner Hamlin.** Instructor and Lecturer on the History and Theory of Architecture, Columbia University School of Architecture Author of *Architecture Through the Ages;* etc.

**T. F. McI.—Thomas Forsyth McIlwraith.** Professor and Head of the Department of Anthropology in the University of Toronto, Canada. Associate Director and Keeper of the Ethnological Collections, Royal Ontario Museum of Archaeology.

**T. Fr.—Thomas Francis, Jr., M.D.** Professor and Chairman of Department of Epidemiology, University of Michigan, Ann Arbor, Mich.

**T. F. T.—Thomas Frederick Tout.** Former Honorary Professor, Manchester University; Professor of History, 1890–1925. Author of *The Place of the Reign of Edward II in English History; Edward the First,* etc.

**T. G.—Thor Germundsson.** Manager, Structural and Railways Bureau, Portland Cement Association.

**T. G. B.—Thomas Gregor Brodie, M.D.** Former Professor of Physiology at St. Thomas's Hospital Medical School, University of London

**T. G. C.—Thomas Gilbert Carver.** Author of *On the Law Relating to the Carriage of Goods by Sea.*

**T. G. G. H.—T. G. G. Heywood,** Lieutenant Colonel, former General Staff Officer, British Territorial Army, Air Defense Formations.

**T. G. H. S.—Theodor George H. Strehlow.** Senior Research Fellow in Australian Linguistics, University of Adelaide, Adelaide, Austr. Author of *Aranda Phonetics and Grammar; Aranda Traditions*

**T. G. M.—Tomás Garrigue Masaryk.** President of the Republic of Czechoslovakia, 1918–35 Author of *The Problem of Small Nations in the European Crisis;* etc.

**T. G. S.—Thomas Gaskell Shearman.** Author of *The Single Tax; Natural Taxation;* etc.

**T. H.—Thomas Hodgkin.** Author of *Italy and Her Invaders; Theodoric the Goth;* etc.

**T. H. B.—Thomas Hannahan Burford, M.D.** Associate Professor of Surgery, Washington University School of Medicine, St Louis, Mo

**T. Her.—Thomas Herdman.** Former Senior Lecturer in Geography and Education, the Training College, Dudley, Eng Author of *Discovery Geography,* Books I and II, *Geography for To-Day—The World.*

**T. H. H.—Sir Thomas Hungerford Holdich.** Superintendent, Frontier Surveys, India, 1892–98 H M. Commissioner for Perso-Baluch Boundary, 1896 Author of *The Indian Borderland; The Gates of India;* etc.

**T. H. Hl.—Theodore H. Hubbell.** Professor of Biology and Geology University of Florida, Gainesville, Fla [illegible] tor of Orthoptera, University of Michigan Museum of Zoology, Ann Arbor, Mich.

**T. H. Hr.—Turner Harcourt Hopper.** Head of the Analytical, Physical-Chemical and Physics Division, Southern Regional Research Laboratory, New Orleans, La

**T. H. J.—Thomas Hope Johnson.** Chairman, Physics Department, Brookhaven National Laboratory, Upton, N Y Chief Physicist, Ballistic Research Laboratory, Aberdeen Proving Ground, Md., 1942–47. Author of *Cosmic Ray Intensity and Geomagnetic Effects*

**T. H. M.—Thomas Hunt Morgan.** Former Professor of Biology, California Institute of Technology, Pasadena, Calif. Former Professor of Experimental Zoology, Columbia University. Nobel Prize for Medicine, 1933. Author of *Evolution and Adaptation;* etc

**T. H. Ma.—Thomas H. Mawson.** Former Consultant to the firm of T. H Mawson & Sons Author of *The Life and Work of an English Landscape Architect;* etc

**T. H. MacD.—Thomas Harris MacDonald.** Commissioner of Public Roads in charge of Public Roads Administration, Federal Works Agency, Washington, D C.

**Th. N.—Theodor Nöldeke.** Professor of Oriental Languages at Strasbourg, 1872–1906. Author of *Geschichte des Korans* and numerous essays

**T. Hn.—Tom Harrisson.** Government Ethnologist and Curator, Sarawak Museum, Sarawak Author of *Borneo Jungle; Britain; Savage Civilization.*

**T. H. P.—Tom Hatherley Pear.** Professor of Psychology, University of Manchester, Manchester, Eng. Temporary Lecturer in Psychology, University of Liverpool, Liverpool, Eng Author of *Remembering and Forgetting; Voice and Personality; The Psychology of Effective Speaking.*

**T. H. R.—Theodore Henry Robinson, D.D.** Professor of Semitic Languages, University College, Cardiff, 1927–44. Author of *An Introduction to the History of Religions;* etc.

**T. H. Rd.—Thomas Harrison Reed.** Municipal Government Counsellor, Connecticut Public Expenditure Council, Inc, 1943–47. Author of *Municipal Government in the United States;* etc.

**T. H.-W.—Thomas Hudson-Williams.** Emeritus Professor of Greek in the University College of North Wales, Bangor. Author of *The Elegies of Theognis,* etc.

**T. H. Wr.—Thomas Huckle Weller, M.D.** Associate Professor of Tropical Public Health, Harvard School of Public Health, Harvard University Assistant Director, Research Division of Infectious Diseases, Children's Medical Center, Boston, Mass.

**T. I.—Sir Thomas Innes of Learney.** Lord Lyon King of Arms Author of *Scots Heraldry;* editor of *Clans, Septs and Regiments of the Scottish Highlands.*

**T. I. C.—Thomas Ira Cook.** Professor, Political Science Department, University of Washington, Seattle, Wash. Author of *A History of Political Theory From Plato to Burke.*

**T. J.—Thorkell Jóhannesson.** Professor in Icelandic History at the University of Iceland, Reykjavik, Ice Author of *Stellung der freier Arbeiter in Island bis zur Mitte des 16 Jahrhunderts 1933; Saga Íslendinga, Vol. VI–VII (1750–1830).*

**T. J. A.—Thomas Joel Anderson, Jr.** Associate Professor of Economics, New York University, New York, N.Y. Author of *Federal and State Control of Banking;* etc.

**T. J. Dn.—Thomas James Dunbabin.** Reader in Classical Archaeology, Oxford University. Author of *The Western Greeks.*

**T. J. E.—T. J. Edwards.** Major. Secretary to the Honours and Distinctions Committee, War Office, London. Author of *The Non-Commissioned Officer's Guide to Promotion in the Infantry.*

**T. J. F.—Thomas James Fielding.** Consulting Engineer. Author of *Photo-electric and Selenium Cells.*

**T. J. K.—Theodore J. Kreps.** Professor of Business Economics, Graduate School of Business, Stanford University, Stanford, Calif. Author of *Economics of the Sulfuric Acid Industry; Some Measurements of the Social Performance of Business;* etc.

**T. J. Sh.—Thomas J. Schoch.** Research Group Leader, Corn Products Refining Company, Argo, Ill.

**T. J. W.—Thomas J. Walsh.** U.S. lawyer. Former Senator from Montana.

**T. K.—Theodore Komisarjevsky.** Former Producer and Art Director of the Moscow State and Imperial Theatre. Author of *The Theatre and Changing Civilization; The Art of the Actor;* etc.

**T. K. C.—Thomas Kelly Cheyne, D.D.** Oriel Professor of the Interpretation of the Scripture, Oxford University, and Canon of Rochester, 1885–1908. Author of *The Prophecies of Isaiah;* etc.

**T. K. H.—Theodora Kimball Hubbard.** Former Associate Editor, *Landscape Architecture.* Co-author of *Introduction to Study of Landscape Design; Landscape Design;* etc. Author of *Manual of Information on City Planning;* etc.

**T. Ki.—Thomas Kirkup.** Author of *An Inquiry into Socialism; Primer of Socialism;* etc.

**T. Km.—Theodore Eustace Kalem.** Contributing Editor, *Time*

**T. K. R.—Sir Thomas Kirke Rose.** Chemist and Assayer of the Mint, 1902–26. Author of *The Metallurgy of Gold; The Precious Metals;* etc

**T. L. B.—Rev. Timothy Lincoln Bouscaren, S.J.** Procurator General, Society of Jesus, Rome, Italy Author of *Canon Law Digest* and *Ethics of Ectopic Operations.*

**T. L. Be.—Thomas L. Blakemore.** Lawyer, Tokyo, Jap Author of *Criminal Code of Japan.*

**T. L. H.—Sir Thomas Little Heath.** Controller-General, National Debt Office, 1919–26 Joint Permanent Secretary to the Treasury and Auditor of the Civil List, 1913–19. Author of *A History of Greek Mathematics; Archimedes; Aristarchus of Samos, the Ancient Copernicus;* etc.

**T. M. C.—Thorne Martin Carpenter.** Former Director, Nutrition Laboratory, Carnegie Institution of Washington, Boston, Mass.

**T. M. F.—Thomas Macall Fallow.** Editor of the *Antiquarian,* 1895–99 Author of *Memorials of Old Yorkshire; The Cathedral Churches of Ireland.*

**T. M. Li.—Rev. Thomas Martin Lindsay, D.D.** Former Principal of the United Free Church College, Glasgow, Scotland Author of *History of the Reformation; Life of Luther;* translation of Ueberweg's *Logic.*

**T. M. T.—T. Marston Till.** Of the British Brush Manufacturers Association, London, England.

**T. N.—Thomas North.** Brigadier General, U S Army. Secretary, American Battle Monuments Commission, 1946–

**T. N. E. G.—Thomas Nall Eden Greville.** Chief, Actuarial Analysis Branch, National Office of Vital Statistics, United States Public Health Service, Washington, D C

**T. N. T.—T. N. Thomson.** Former Consulting Engineer and Technical Editor, *Plumbers and Heating Contractors Trade Journal.*

**T. O.—Thomas Okey.** Former Professor of Italian, Cambridge University.

**T. P.—Thomas Parran, M.D.** Dean, Graduate School of Public Health, University of Pittsburgh, Pittsburgh, Pa. Author of *Shadow on the Land.*

**T. Pk.—Thomas Park.** Professor of Zoology, The University of Chicago.

**T. P. K.—Truman Paul Kohman.** Fellow in Chemistry, Institute for Nuclear Studies, The University of Chicago.

**T. P. Ma.—Thomas Powderly Martin.** Assistant Chief and Acting Chief, Manuscript Division, Library of Congress, Washington, D.C. Former Associate Professor of History, Boston University, Boston, Mass.

**T. P. Mc.—Thomas Potter McCutcheon.** Professor of Inorganic Chemistry, University of Pennsylvania, Philadelphia, Pa. Co-author of *General Chemistry.*

**T. Ra.—Terry Ramsaye.** Editor, *Motion Picture Herald* and *Motion Picture Almanac.* Author of *A Million and One Nights—A History of the Motion Picture.*

**T. R. P.—Thomas Reed Powell.** Emeritus Professor of Law, Harvard University. Former Special Assistant to Attorney General of U S Author of *Separation of Powers;* etc.

**T. R. P. G.—Thomas R. P. Gibb, Jr.** Associate Professor and Director of Sponsored Research in Chemistry, Tufts College, Medford, Mass. Author of *A Practical Treatise on the Hydrides of Metals and Metalloids; Optical Methods of Chemical Analysis.*

**T. R. Ph.—Thomas Raphael Phillips.** Brigadier General, U S.A. Department Chairman, Joint Export-Import Agency, United States—United Kingdom, Office of Military Government in Germany, 1941–47 Author of *Roots of Strategy; The New Face of War;* etc.

**T. S.—Thomas Seccombe.** Former Lecturer in History, East London and Birkbeck Colleges, University of London Assistant Editor of *Dictionary of National Biography,* 1891–1901. Author of *The Age of Johnson;* etc.

**T. S. Gy.—Theophilus Stephen Gregory.** Producer, Talks Department, British Broadcasting Corporation, London. Author of *The [illegible]*.

**T. Sm.—Thomas E. Smith.** Superintendent of Light Division, National Physical Laboratory, Teddington, England.

**T. Sn.—Thorsten Sellin.** Professor of Sociology, University of Pennsylvania, Philadelphia, Pa. Editor, *The Annals of the American Academy of Political and Social Science.* Author of *Crime in the Depression; The Criminality of Youth; Culture Conflict and Crime; Pioneering in Penology.*

**T. S. Pe.—Theodore Stephen Page.** Barrister-at-law of the Inner Temple, London. Former Senior Press Censor, Ministry of Information, London

**T. S. R.—Tyler Stewart Rogers.** Technical Director, Owens-Corning Fiberglas Corporation, Toledo, O. Author of *Plan Your Home to Suit Yourself.*

**T. S. T.—Thomas Smith Tait.** Director of Standardization, Ministry of Works and Buildings, 1940–42.

**T. T.—Sir Travers Twiss.** Former Professor of Political Economy and Civil Law, Oxford University, and of International Law, University of London. Author of *The Nations in Peace;* etc.

**T. V. H.—Thomas V. Haney.** Member of the Staff, *New York Times,* New York, N.Y.

**T. W.—Thomas Woodhouse.** Former Head of Weaving and Textile Designing Department, Technical College, Dundee, Scotland.

**T. W. A.—Sir Thomas Walker Arnold.** Former Professor of Arabic, University of London. Former Professor of Philosophy, Government College, Lahore, India.

**T. W. C.—T. W. Casey.** Assistant Secretary, Ministry of Pensions, London, Eng.

**T. W.-D.—Theodore Watts-Dunton.** Author of *The Renascence of Wonder;* etc.

**T. W. F.—Thomas W. Fox.** Former Professor of Textiles in the University of Manchester, England. Author of *Mechanics of Weaving.*

**T. Wi.—Thomas Wilfred.** Founder of the Clavilux Laboratory, New York, N.Y. Inventer of the Clavilux.

**T. W. J. T.—Sir Thomas Weston Johns Taylor.** Former Principal, University College of the South-West of England, Exeter, Eng. Editor of the third English edition of Richter-Anschutz's *Chemie der Kohlenstoffverbindungen*

**T. W. R.—Theodore William Richards, M.D.** Former Professor of Chemistry and Director of the Walcott Gibbs Memorial Laboratory, Harvard University. Nobel Prize for Chemistry, 1914.

**T. W. R. D.—T. W. Rhys Davids.** Former Professor of Comparative Religion in the University of Manchester, England Former Professor of Pali and Buddhist Literature, University College, University of London Author of *Buddhism, Its History and Literature.*

**T. Wy.—Thomas Woody.** Professor of Education, University of Pennsylvania, Philadelphia, Pa. Author of *A History of Women's Education in the United States; Life and Education in Early Societies.*

**U. E. B.—Urbanus Edmund Baughman.** Chief, United States Secret Service U S Department of the Treasury, Washington, D.C.

**U. G. F.—Urban Gerard Flanagan.** Lecturer, University College, Cork, Irc Editor of Calendar of Papal Registers (P.R.O ).

**U. L.—Uberto Limentani.** Lecturer in Italian, Cambridge University Author of *Poesie e [illegible] di Salvator Rosa; L'attività letteraria di Giuseppe Mazzini.*

**U. R. E.—Ulick Richardson Evans.** Reader in the Science of Metallic Corrosion, Cambridge University. Author of *Metals and Metallic Compounds; Metallic Corrosion Passivity and Protection.*

**U. W.—Ulrich F. Westphal.** Chief, Protein Section, Biochemistry Department, Army Medical Research Laboratory, Fort Knox, Ky.

**V. A. S.—Vernon Arthur Stenger.** Analytical Research Chemist, Dow Chemical Company, Midland, Mich. Co-author of *Volumetric Analysis,* Vol. I and II.

**V. Br.—Victor Branford.** Chairman of Council (British) Sociological Society.

**V. Bu.—Vannevar Bush.** Chairman, Joint Research and Development Board, Joint Chiefs of Staff. Director, Office of Science Research and Development; President, Carnegie Institution of Washington. Professor of Electric Power Transmission, Massachusetts Institute of Technology, 1919–32, Vice-President and Dean of Engineering, 1932–38. Author (with W. H Timbie), *Principles of Electrical Engineering; Operational Circuit Analysis.*

**V. Bw.—Virginia Bartow.** Assistant Professor of Chemistry, University of Illinois, Urbana, Ill.

**V. B. W.—V. B. Wigglesworth.** Director of Agricultural Research Council, Unit of Insect Physiology Former Reader in Entomology, University of London, 1936–44 Author of *The Principles of Insect Physiology*

**V. C. As.—Vladimir C. Asmous.** Assistant Librarian, Arnold Arboretum, Harvard University, Jamaica Plain, Mass.

**V. C. C. C.—V. C. C. Collum.** Fellow of the Royal Archaeological Institute of Great Britain and Ireland.

**V. Cn.—Vern Countryman.** Assistant Professor, Yale University Law School, New Haven, Conn.

**V. C. T.—Victor Chandler Twitty.** Professor of Biology, Stanford University, Stanford, Calif.

**V. D.—Victor Donahey.** United States Senator from Ohio, 1935–41; Governor, State of Ohio, 1923–29.

**V. E. J.—Vincent E. Jakl.** Regional Director, U S. Weather Bureau Office, Chicago, Ill.

**V. E. M.—V. E. McKelvey.** Chief, Trace Elements Office, Geological Survey, U S. Department of the Interior, Washington, D.C.

**V. E. N.—Victor Ewings Negus.** Surgeon, Ear, Nose and Throat Department, King's College Hospital, London Former Lecturer at King's College Hospital Medical School.

**V. F. M.—Vladimir F. Minorsky.** Emeritus Professor of Persian in the University of London. Lecturer of Persian Literature, Turkish and Oriental History at the École Nationale des Langues Orientales Vivantes, Paris, 1923–34.

**V. G. C.—V. Gordon Childe.** University Professor of Prehistoric European Archaeology and Director of the Institute of Archaeology, London, 1946– Librarian to Royal Anthropological Institute, 1925–27. Professor of Prehistoric Archaeology, Edinburgh, 1927–46. Author of *The Aryans;* etc.

**V. G. G.—Vernon Guy Grove.** Professor of Mathematics, Michigan State College of Agriculture and Applied Science, East Lansing, Mich

**V. H.—Viktor Hamburger.** Professor of Zoology; Head, Department of Zoology, Washington University, St. Louis, Mo. Author of *Manual of Experimental Embryology.*

**V. H. B.—Vernon Herbert Blackman.** Chairman, Forest Products Research Board, 1939–47 Director of Research, Institute of Plant Physiology, Imperial College of Science and Technology, University of London, 1913–43.

**V. J.—Vera Javarek.** Lecturer in Serbo-Croatian Languages and Literature, School of Slavonic and East European Studies, University of London.

**V. J. S.—Vincent Joseph Schaefer.** Research Chemist, General Electric Research Laboratory, Schenectady, N.Y.

**V. K.—Vernon Kellogg.** Former Secretary, National Research Council, Washington D.C. Author of *Scientific Aspects of Luther Burbank's Works; Evolution;* etc

**V. Kr.—Victor Kramer.** Laundry management consultant Author of *Establishing and Operating a Laundry.*

**V. Kz.—Vernon Kinietz.** Agriculturalist Author of *Chippewa Village; The Indians of the Western Great Lakes, 1615–1760.*

**V. K. Z.—Vladimir Kosma Zworykin.** Vice-President and Technical Consultant, Electronic Research, RCA Laboratories Division, Radio Corporation of America, Princeton, N.J Author of *Photocells and Their Applications;* etc.

**V. L. K.—Vincent Lorne Kennedy.** Professor, Greek and Christian Archaeology, St. Michael's College, University of Toronto, Canada. Professor, History of Christian Worship, Pontifical Institute of Mediaeval Studies, Toronto, 1935–43. Author of *The Saints of the Canon of the Mass.*

**V. L. P.—Vernon Louis Parrington.** Former Professor of English in the University of Washington, Seattle, Wash. Author of *Main Currents in American Thought*

**V. N.—Virgil Ney.** Lieutenant Colonel, U.S. Army. Office of the Executive for Reserve and ROTC Affairs, Department of the Army, Washington, D C. Author of *Arms Collectors of the United States.*

**V. M.—Vartkes Migrdichian.** Chemist, American Cyanamid Company, Stamford, Conn Author of *Chemistry of Organic Cyanogen Compounds.*

**V. M. Ra.—Vincent M. Rabuffo.** Editor, *Ice Cream Trade Journal.* Author of *Packaged Profits.*

**V. O. K.—V. O. Key, Jr.** Alfred Cowles Professor of Government, Yale University, New Haven, Conn Author of *The Administration of Federal Grants to States;* etc.

**V. Pi.—Vivian Pierce.** Director, American League to Abolish Capital Punishment.

**V. Ps.—Victor Paschkis.** Technical Director, Heat and Mass Flow Analyzer Laboratory. Department of Mechanical Engineering, Columbia University, New York, N.Y. Author of *Industrial Electric Furnaces.*

**V. R. B.—Victor Rickman Boswell.** Principal Horticulturist and Assistant Head of Division of Fruit and Vegetable Crops and Diseases, Bureau of Plant Industry, U.S. Department of Agriculture.

**V. R. C.—V. R. Croswell.** Of the Hercules Powder Company, Wilmington, Del.

**V. S.—Vilhjalmur Stefansson.** Commander of the Canadian Arctic Expedition under the auspices of the American Museum of Natural History and the Geological Survey of Canada, 1908–12; and of several other expeditions to Arctic regions. Author of *My Life with the Eskimo;* etc.

**V. Sd.—Vera Sanford.** Professor of Mathematics, State Teachers College, Oneonta, N.Y.

**V. S. J.—Vernon S. Jones.** Member of firm of Kirlin, Campbell, Hickox and Keating, lawyers, New York, N.Y.

**V. Sn.—Virgil Snyder.** Emeritus Professor of Mathematics, Cornell University, Ithaca, N.Y.

**V. St.—Verney Stott.** Senior Scientific Officer, Metrology Department, National Physical Laboratory, Teddington, England.

**V. Sta.—Vincent Starrett.** Book Columnist, *Chicago Sunday Tribune.* Author of *The Private Life of Sherlock Holmes; Books Alive;* etc.

**V. T.—V. Tolnai.** Former Professor of History of Hungarian Literature, University of Pécs, Hungary.

**V. T. A.—Victor Thomas Allen.** Director, Geology Department, St. Louis University, St. Louis, Mo. Author of *This Earth of Ours; The Ione Formation of California.*

**V. Tn.—Virginia Thompson.** With Institute of Pacific Relations, 1936–42. Author of *French Indo-China; Postmortem in Malaya;* etc.

**V. W. B.—Van Wyck Brooks.** Author of *America's Coming-of-Age; The World of H. G Wells; The Pilgrimage of Henry James; The Ordeal of Mark Twain; The Flowering of New England, 1815–1865;* etc.

**V. W. M.—Villiers Willson Meloche.** Professor of Chemistry, University of Wisconsin, Madison, Wis.

**W.—Wang Chi-Wu.** Research Associate, Harvard Forest, Harvard University, Petersham, Mass. Author of *The Vegetation of Eastern Asia.*

**W. A. A.—W. A. Aitken, D.V.M.** Editor in Chief, *Journal of the American Veterinary Medical Association.*

**W. A. B.—Wyndham A. Bewes.** Barrister-at-Law. Former Honorary Secretary of the International Law Association and Grotius Society.

**W. A. B. C.—Rev. William Augustus Brevoort Coolidge.** Former Fellow of Magdalen College Oxford Editor of *The Alpine Journal* 1880–87 etc.

**W. A. Be.—W. A. Bettesworth.** Former Sports Editor of *The Field.*

**W. A. Ben.—Wilson Alwyn Bentley.** Author of many monographs relating to the subjects of snow, rain, dew, frost and clouds.

**W. A. Bn.—W. A. Benton.** Second Chief of the Research Department of Messrs W. T. Avery, Ltd, Birmingham, England.

**W. A. Br.—William Adams Brown, D.D.** Former Professor of Theology, Union Theological Seminary, New York, N.Y. Author of *The Essence of Christianity; Christian Theology in Outline;* etc.

**W. A. Dn.—William Aubrey Darlington.** Drama Editor and Chief Drama Critic, the *Daily Telegraph,* London. London Drama Correspondent, the *New York Times.* Author of *The Actor and His Audience; J. M. Barrie; The World of Gilbert and Sullivan; Literature in the Theatre;* etc.

**W. A. F.—William A. Flère.** River Division, Port of London Authority, London.

**W. A. G.—William Addleman Ganoe.** Colonel, United States Army. Theatre Historian, European Theatre of Operations, 1943–46. Director, Public Relations Division, First Army, 1941. Author of *The History of the United States Army; Soldiers Unmasked;* etc.

**W. A. Go.—William A. Good.** Editor for the Associated Press, New York, N.Y.

**W. A. H.—W. A. Hanton.** Head of the weaving section, Textile Department, Manchester Municipal College of Technology, Manchester, England.

**W. A. Ha.—William Allen Hamor.** Assistant Director of Mellon Institute of Industrial Research, Pittsburgh, Pa. Co-author of *The Examination of Petroleum;* etc.

**W. A. Har.—William Andrew Hardenbergh.** Colonel, Sanitation Corps, and Chief of Division of Sanitary Engineering, U.S. Army.

**W. A. Hh.—William Aquinas Hinnebusch.** Professor of Mediaeval History, Providence College, Providence, R.I.

**W. A. I.—William A. Irwin.** Emeritus Professor of Old Testament Language and Literature, The University of Chicago.

**W. A. J.—Walter Albert Jessup.** Former President, State University of Iowa, Iowa City. President, Carnegie Foundation for the Advancement of Teaching, 1934–44.

**Wa. L.—Walter Lichtenstein.** Adviser, United States Control Council, Germany.

**W. A. L. E.—William Alexander Leslie Elmslie, Hon. D.D.** Professor of Hebrew and Old Testament Literature and Principal in Westminster College, Cambridge. Author of *Five Great Subjects; How Came Our Faith;* etc.

**W. A. M.—W. A. Mitchell.** Brigadier General, U.S.A. Colonel of the Corps of Engineers during World War I Former Professor of Military Engineering and Military Art at U.S. Military Academy West Point, N.Y.

**W. A. Ml.—(Mrs.) Winifred Alice Maxwell.** Professor of History, Rhodes University College, Grahamstown, South Africa

**W. A. N.—William Allan Neilson.** President, Smith College, Northampton, Mass., 1917–39. Author of *Essentials of Poetry;* etc

**W. A. P.—Walter Alison Phillips.** Lecky Professor of Modern History, University of Dublin, Dublin, Ire., 1914–39. Former contributor to the *Cambridge Modern History;* etc.

**W. A. Ph.—William A Phair.** Associate Editor, *The Iron Age.*

**W. A. Po.—William A. Poucher.** Consulting chemist in perfumery, cosmetics and industrial problems.

**W. A. R.—William Alfred Reid.** Former Foreign Trade Adviser, Pan American Union Lecturer on Latin American Commerce at the School of Foreign Service, Georgetown University, Washington, D.C. Author of *Ports and Harbours of South America;* etc

**W. A. Sh.—William A. Smith.** President, Advance-Independent Electrotype Company, Indianapolis, Ind

**W. A. S. H.—William Albert Samuel Hewins.** Secretary of the British Tariff Commission, 1903–17 Former Director of the London School of Economics Author of *Trade in the Balance; Empire Restored;* etc.

**W. A. Sr.—Wilbur Augustus Sawyer, M.D.** Director of Health, United Nations Relief and Rehabilitation Administration, 1944–47. Director, International Health Division, Rockefeller Foundation, New York, N.Y., 1935–44.

**W. A. St.—William Aiken Starrett.** President, The Starrett Corporation and Vice-President of Starrett Brothers Incorporated, New York, N.Y., 1922–32. Author of *Skyscrapers and the Men Who Build Them*

**Wa. V. W.—Walton Van Winkle, Jr.** Director of Research, Ethicon Suture Laboratories Incorporated, New Brunswick, N.J.

**W. A. W.—W. A. Wooster.** Demonstrator in Mineralogy in Cambridge University.

**W. Ay.—Wallace Ashby.** Principal Agricultural Engineer In Charge of Farm Structures Investigations, Bureau of Plant Industry, Soils, and Agricultural Engineering, Agricultural Research Administration, U.S. Department of Agriculture, Beltsville, Md.

**W. B.—Wilhelm Bousset.** Former Professor of New Testament Exegesis in the University of Göttingen, Germany. Author of *The Antichrist Legend;* etc.

**W. Ba.—William Bacher.** Professor, Rabbinical Seminary, Budapest, Hungary.

**W. B. Bt.—Wyatt Brearley Brummitt.** Editor, Amateur Photographic Publications Eastman Kodak Co., Rochester, N.Y. Author of *How to Make Good Pictures;* etc.

**W. B. Ck.—William Bell Clark.** Vice-President, N. W. Ayer & Son, Advertising, 1939–47. Member, Naval History Foundation. Author of *Lambert Wickes, Sea Raider and Diplomat;* etc.

**W. B. Co.—William B. Cox.** Field Secretary and Prison Investigator of the National Society of Penal Information.

**W. B. D.—William Bell Dinsmoor.** Professor of Archaeology and Executive Officer, Department of Fine Arts, Columbia University Professor of Architecture, American School of Classical Studies at Athens, 1924–28 Associate Editor, *American Journal of Archaeology* Co-author of *The Architecture of Ancient Greece.*

**W. B. Dn.—Winton Basil Dean.** Author of *Bizet; Carmen;* etc.

**W. Be.—William Beebe.** Curator of Ornithology and Director of Department of Scientific Research, New York Zoological Society. Author of *Galapagos; World's End*

**W. B. E.—Walter Bryan Emery.** Edwards Professor of Egyptology, University of London Author of *Great Tombs of the First Dynasty; Hor-Aha; Nubian Treasure; The Royal Tombs of Ballana and Qustol; The Tomb of Hemaka.*

**W. B. Fg.—William Buller Fagg.** Assistant Keeper, Department of Ethnography, British Museum, London. Hon. Secretary, Royal Anthropological Institute Author of *The Webster Plass Collection of African Art.*

**W. B. Fr.—William Bayne Fisher.** Senior Lecturer in Geography, University of Aberdeen, Aberdeen, Scot Author of *The Middle East: A Physical, Social and Regional Geography.*

**W. B. G.—William Benjamin Gregory.** Former Professor of Experimental Engineering and Hydraulics, Tulane University, New Orleans, La.

**W. B. H.—Walter Burton Harris.** Former Correspondent of the *Times* (London) in Morocco Author of *Morocco That Was.*

**W. B. He.—William B. Hesseltine.** Professor of History, University of Wisconsin, Madison, Wis. Author of *The South in American History;* etc

**W. B. Ho.—William Bowyer Honey.** Keeper, Department of Ceramics, Victoria and Albert Museum, London. Author of *Old English Porcelain;* etc.

**W. B. Ht.—W. Ben Hunt.** Author of *Indian and Camp Handicraft; Indiancraft.*

**W. Bi.—Walter Binni.** Professor of Italian Literature, University of Genoa, Genoa, It Author of *La poetica del decadentismo italiano;* etc.

**W. Bl.—Walter Blair.** Professor of English Literature, The University of Chicago.

**W. Bm.—William Bloom.** Professor of Anatomy, The University of Chicago.

**W. Bn.—Walter J. Brown.** Manager, Publicity Department, San Francisco Chamber of Commerce, San Francisco, Calif.

**W. B. P.—William Belmont Parker.** Former Editor of *South Americans of Today.* Author of *Chileans of Today; Paraguayans of Today;* etc.

**W. B. Pn.—Wheeler B. Preston.** Former author and publicist.

**W. B. Py.—Walter Bowers Pillsbury.** Emeritus Professor of Psychology, University of Michigan, Ann Arbor, Mich. Author of *History of Psychology; Fundamentals of Psychology.*

**W. Br.—William Brown, M.D.** Wilde Reader in Mental Philosophy and Director of the Institute of Experimental Psychology, Oxford University, 1936–45. Director of the Psychological Laboratory at King's College, University of London, 1908–21. Author of *Mind and Personality.*

**W. B. R.—Wilbur B. Rayton.** Former Director, Scientific Bureau, Bausch & Lomb Optical Company, Rochester, N.Y.

**W. B. R. K.—William Bernard Robinson King.** Professor of Geology, Cambridge University, 1943–

**W. Bro.—William Brown.** Professor of Plant Pathology of the University of London and Head of the Botanical Department at the Imperial College of Science and Technology, University of London.

**W. Bu.—William Charles Burges.** Town Clerk, City of Newcastle, Austr

**W. B. S.—William Barclay Squire.** Former Assistant in charge of Printed Music, British Museum, London, and Honorary Secretary of the Purcell Society.

**W. B. Sh.—Wilfred Byron Shaw.** Director, Bureau of Alumni Relations, University of Michigan, Ann Arbor, Mich Editor of *Michigan Alumnus: Quarterly Review.* Author of *The University of Michigan;* etc.

**W. B. Sm.—William Benjamin Smith.** Former Professor, Tulane University, New Orleans, La.

**W. Bu.—William Burrows.** Associate Professor of Bacteriology, The University of Chicago Author of *Textbook of Bacteriology.*

**W. B. W.—William Basil Worsfold.** Editor of the *Johannesburg Star,* 1904–05. Author of *A History of South Africa;* etc.

**W. B. Wo.—W. Birkbeck Wood.** Sometime Classical Scholar of Worcester College, Oxford Author of *A History of the Civil War in the United States.*

**W. By.—Hon. Wilfrid Bovey.** Member, Legislative Council Quebec, Canada. Author of *The French Canadian Today;* etc

**W. C. A.—W. C. Allee.** Head Professor of Biology, University of Florida, Gainesville, Fla Author of *Animal Aggregations; Social Life of Animals.*

**W. C. An.—William Christopher Atkinson.** Stevenson Professor of Spanish, University of Glasgow, Glasgow, Scot. Author of *Spain: A Brief History.*

**W. C. Re.—William Cabell Bruce.** Member of the United States Senate, 1923–29. Author of *John Randolph of Roanoke;* etc.

**W. C. Ben.—Wendell Clark Bennett.** Professor of Anthropology, Yale University, 1945–53. Associate Professor of Anthropology, University of Wisconsin, Madison, Wis, 1938–40.

**W. C. B. T.—William Cuthbert Brian Tunstall.** Lecturer in International Relations, London School of Economics. Lecturer in History and English, Royal Naval College, Greenwich, 1925–37 Member of B B.C Research Unit (Overseas), 1941. Naval Correspondent, B.B.C European Services, 1942–45. Author of *The Realities of Naval History;* etc.

**W. C. Dr.—Sir William Cecil Dampier.** Fellow of Trinity College, Cambridge, 1891. Sometime Chairman of the Home Office Committee on the Lighting of Factories and of the Machinery Committees of the Ministry of Agriculture Author of *The Theory of Experimental Electricity;* etc.

**W. C. G.—Wayne C. Grover.** Archivist of the United States. General Services Administration, Washington, D.C.

**W. C. Ha.—Sir William Clarke Hall.** Former Metropolitan Magistrate and Chairman of the Shoreditch Juvenile Court, England. Author of *The Law Relating to Children;* etc.

**W. C. J.—Warren C. Johnson.** Chairman, Department of Chemistry, and Associate Dean, Division of the Physical Sciences, The University of Chicago Author of *Ionic Equilibrium as Applied to Qualitative Analysis; Qualitative Analysis and Chemical Equilibrium.*

**W. Ck.—Walter Clark.** Technical Assistant to Vice-President in Charge of Research and Development, Eastman Kodak Company, Rochester, N Y Author of *Photography by Infrared: Its Principles and Practice.*

**W. C. K.—William Calvert Kneale.** Fellow of Exeter College, Oxford. Lecturer in Philosophy, Oxford University. Author of *Probability and Induction.*

**W. C. M.—Walter Conrad Muenscher.** Professor of Botany, Cornell University, Ithaca, N.Y. Author of *Weeds* (of the United States); *Poisonous Plants of the United States,* etc.

**W. C. N.—Winthrop C. Neilson.** President, Republic Mining and Manufacturing Company, Pittsburgh, Pa.

**W. C. Ny.—Wayne C. Neely.** Professor of Sociology, Hood College, Frederick, Md. Author of *The Agricultural Fair.*

**W. C. P.—W. Conway Pierce.** Chairman, Department of Chemistry, Pomona College, Claremont, Calif. Author of *Quantitative Analysis.*

**W. Cr.—Walter Crane.** Art Director of Reading College, England, 1896. Principal of the Royal College of Arts, 1898.

**W. C. R.—William C. Reavis.** Emeritus Professor of Education, The University of Chicago. Author of *Administering the Elementary School; Duties of School Principals.*

**W. Cro.—William Crocker.** Former Managing Director of the Boyce Thompson Institute for Plant Research, Inc, Yonkers, N Y.

**W. C. Rs.—Walter C. Reckless.** Professor of Criminology and Penology, Ohio State University, Columbus, O Author of *The Crime Problem; Criminal Behavior.*

**W. C. T.—W. Cave Thomas.** Author of *Mural or Monumental Decoration; Revised Theory of Light;* etc.

**W. C. Wh.—William C. White.** Electronics Engineer, General Electric Research Laboratory, General Electric Company, Schenectady, N.Y.

**W. Da.—W. Dalton.** Author of *Bridge Abridged, or Practical Bridge.*

**W. D. A.—Winfield Dockery Armentrout.** Vice-President, Colorado State College of Education, Greeley, Colo. Author of *The Conduct of Student Teaching in State Teachers' College.*

**W. D. C.—William D. Clark.** Former Assistant Director, British Information Services, Chicago, Ill.

**W. de B. H.—William de Bracy Herbert.** Former Recorder of Newcastle under Lyme, England.

**W. D. F.—Walter Deane Fuller.** President, Curtis Publishing Company, Philadelphia, Pa.

**W. D. G.—William D. Grampp.** Vice-Consul in the American Foreign Service Auxiliary, the Department of State. Former Professor of Economics, Elmhurst College, Elmhurst, Ill.

**W. Di.—Wayne Dinsmore.** Secretary, Horse Association of America Co-author of *A History of the Percheron Horse*

**W. Dk.—William Dameshek, M.D.** Professor of Clinical Medicine, Tufts College Medical School, Medford, Mass. Senior Physician and Haematologist, New England Center Hospital, Boston, Mass.

**W. D. Kr.—Walter David Keller.** Professor of Geology, University of Missouri, Columbia, Mo Author of *Common Rocks and Minerals of Missouri.*

**W. D. L.—William Draper Lewis.** Director, American Law Institute, Philadelphia, Pa, 1923–47. Professor of Law, University of Pennsylvania, Philadelphia, 1896–1924, Dean of Law Department, 1896–1914. Editor of *Great American Lawyers;* etc.

**W. D. La.—Walter Davis Lambert.** Principal Mathematician and Chief of the Section of Gravity and Astronomy, U S. Coast and Geodetic Survey. Author of *The Effect of the Change of Spheroid on the Mapping of a Region;* etc.

**W. D. M.—William Diller Matthew.** Former Professor of Palaeontology, and Director, Museum of Palaeontology, University of California, Curator in Chief of The American Museum of Natural History, New York, N Y.

**W. D. Os.—William David Ollis.** Lecturer in Organic Chemistry, University of Bristol, Eng.

**W. D. Oy.—William D. Owsley.** Vice-President for Engineering Advice to Management, Halliburton Oil Well Cementing Company, Duncan, Okla. Author of *Drilling Practices.*

**W. Ds.—William Davis.** Professor of Textile Industries, University College, Nottingham, England.

**W. Du.—William James Durant.** Author of *The Story of Philosophy;* etc.

**W. Dy.—Walter Duranty.** Correspondent of North American Newspaper Alliance in Europe, U.S.S.R., Japan, 1939–41 Correspondent in Moscow for *The New York Times,* 1921–34. Author of *The Kremlin and the People;* etc.

**W. E.—William Henry Eccles.** President of the Institute of Electrical Engineers, 1926–27. Former Professor of Applied Physics and Electrical Engineering City and Guilds of London Technical College, Finsbury.

**W. E. A.—W. E. Armstrong.** Former Lecturer on Social Anthropology, Cambridge.

**W. E. A. A.—William Edmund Armytage Axon.** Sometime Deputy Chief Librarian of the Manchester Free Libraries, Manchester, England.

**W. E. Ai.—Wellington E. Aiken.** Emeritus Professor of English, University of Vermont, Burlington, Vt.

**W. E. B.—William Edgar Borah.** United States Senator from Idaho, 1907–43.

**W. E. Ba.—William Emery Barnes, D.D.** Former Fellow of Peterhouse, Professor of Divinity and Dean, Christ's College, University. Hulsean Professor of Divinity, Cambridge, 1901–34.

**W. E. Bn.—Walton E. Bean.** Instructor in History, University of California, Berkeley, Calif.

**W. E. Bt.—William E. Brandt.** Author and radio commentator.

**W. E. By.—Wilfred E. Binkley.** Professor of Political Science, Ohio Northern University, Ada, O. Author of *American Political Parties: Their Natural History; President and Congress.*

**W. E. C.—Walter E. Collinge.** Keeper of the Yorkshire Museum, York, England, 1933–47 Former Editor of *The Journal of Zoological Research,* and Lecturer on Economic Zoology, University of Birmingham.

**W. E. Cl.—William Elmer Caldwell.** Associate Professor of Chemistry, Oregon State College, Corvallis, Ore. Author of *General Chemistry; Semimicro Qualitative Analysis.*

**W. E. Cn.—W. E. Collin.** Associate Professor, Department of Romance Languages, University of Western Ontario, London, Ont. Author of *Clockmaker of Souls; The White Savannahs.*

**W. E. Co.—Rt. Rev. William Edward Collins, D.D.** Former Bishop of Gibraltar. Former Professor of Ecclesiastical History, King's College, University of London, and Lecturer, St. John's and Selwyn Colleges, Cambridge Author of *The Beginnings of English Christianity*

**W. E. Cu.—William Edward Curtis.** Professor of Physics, King's College, Newcastle-on-Tyne, University of Durham, England Scientific Adviser, Research and Experiments Department, Ministry of Home Security, 1940–43

**W. E. Cx.—Warren Earle Cox.** Lecturer on decoration and craftsmanship

**W. E. D.—W. Ernest Dalby.** Former Dean and Professor of Engineering at the City and Guild's Engineering College of the Imperial College of Science and Technology, University of London.

**W. E. Dn.—Walter Edmund Doran.** Chief Engineer, Great Ouse River Board, Cambridge, Eng.

**W. E. E.—Walter Elmer Ekblaw.** Professor of Geography, Clark University, Worcester, Mass., 1926–49. Assistant Editor, *Economic Geography,* 1924–49.

**W. E. F.—W. E. Forsythe.** Physicist, General Electric Company, Cleveland, O, 1913–46 Co-author of *Fluorescent Lamps.*

**We. G.—Werner Goldschmidt.** Profesor contratado de dedicacion exclusiva de Derecho Internacional Privado Director of the corresponding section at the National University of Tucumán, Tucumán, Arg. Author of *Sistema y filosofía del Derecho Internacional Privado, con especial consideracion del Derecho Internacional Privado Español.*

**W. E. Gr.—Walter Ervin Gloor.** Plastics Supervisor, Hercules Powder Company, Parlin, N J

**W. E. Gs.—Willard E. Givens.** Executive Secretary of the National Education Association, 1935–

**W. E. H.—William Ernst Hocking, D.D.** Chairman of Department of Philosophy, Harvard University, 1937–43. Author of *The Meaning of God in Human Experience; Science and the Idea of God;* etc.

**W. E. Hd.—W. E. Howland.** Professor of Sanitary Engineering and Educational Consultant to the Dean of Engineering, Purdue University, Lafayette, Ind.

**W. E. I.—William Edmund Ironside, 1st Baron Ironside of Archangel and of Ironside.** Field Marshal. Commander in Chief, Home Forces, 1940 Commander in Chief, Allied Troops in Russia, 1918–19. Commandant, Staff College, Camberley, 1922–26. Chief of the Imperial General Staff, 1939–40. Author of *Tannenberg: The First Thirty Days in East Prussia.*

**W. E. K. M.—William E. Knowles Middleton.** Meteorologist, Meteorological Service, Toronto, Ont., Can. Author of *Visibility in Meteorology;* etc.

**W. E. L.—William Egbert Leveson.** Assistant Secretary, 1896–1906, and Secretary, 1906-18, to the Council for the Foreign Community of Shanghai north of the Yang King Pang.

**W. E. M.—W. E. Morton.** Professor of Textile Technology in the University of Manchester, England Author of *An Introduction to the Study of Spinning;* etc.

**W. E. Ma.—Wilbur E. Mallalieu.** General Manager, National Board of Fire Underwriters, New York, N Y.

**W. E. My.—William Edward May.** Commander, Royal Navy Naval Assistant to Director, Compass Department, Admiralty.

**W. En.—William Ebenstein.** Associate Professor of Political Science, University of Wisconsin, Madison, Wis. Author of *The Nazi State;* etc.

**W. E. P.—William E. Powers.** Professor of Geography, Northwestern University, Evanston, Ill. Co-author of *Introduction to Weather and Climate.*

**W. E. S.—Walter Earl Spahr.** Professor of Economics, School of Commerce, Accounts and Finance, and Chairman of the Department of Economics, New York University

**W. E. Ss.—Wayne Edson Stevens.** Professor of History, Dartmouth College, Hanover, N H.

**W. E. T.—William Edward Tate.** Lecturer, University of Leeds, Leeds, Eng. Author of *His Worship the Mayor; The Parish Chest* Editor of *English Inn Signs*

**W. E. Th.—Wendell E. Thorne.** International Section, Division of Research and Statistics, Board of Governors of the Federal Reserve System.

**W. E. W.—W. E. Wornum.** Technical and Research Chemist, Mander Brothers, Ltd, Wolverhampton, England.

**W. E. Wa.—William E. Warne.** Assistant Secretary, Department of the Interior, Washington, D C Assistant Commissioner, Bureau of Reclamation, Department of the Interior, 1943–47.

**W. E. Wh.—Wallace Edward Whitehouse.** Acting Head of Department of Geography, University College of Wales, Aberystwyth, 1941–46.

**W. F.—William Fairweather, D.D.** Minister of Dunniker, United Free Church, Kirkcaldy, N.B. Author of *The Background of the Gospels;* etc.

**W. F. A.—William F. Albright** Chairman, Oriental Seminary, Th[illegible] University, Baltimore, Md Author of *The Excavation of Tell Beit Mirsim; From the Stone Age to Christianity.*

**W. F. B.—Walter Francis Bogner.** Architect. Associate Professor of Architecture, School of Design, Harvard University.

**W. F. C.—William Feilden Craies.** Former Lecturer on Criminal Law, King's College, University of London. Editor of Archbold's *Criminal Pleading* (23rd edition).

**W. F. Cs.—William F. Christians.** Associate Professor of Geography, Wharton School, University of Pennsylvania, Philadelphia, Pa. Co-author of *Economic Geography of South America.*

**W. Fd.—Walter Armitage Justice Ford.** Former Professor of Singing at the Royal College of Music and University of Reading, England.

**W. F. D.—Walter Fairleigh Dodd.** Professor of Law, 1927–30, and Research Associate Professor, 1930–33, Yale University. Author of *Modern Constitutions;* etc.

**W. F. F.—William Frederick Friedman.** Principal Cryptanalyst, U.S. War Department, Washington, D.C. Director of Signal Intelligence School, War Department. Chief of Signal Intelligence Service, 1930–40. Author of *Elements of Cryptanalysis;* etc.

**W. F. Fr.—Walter Francis Frear.** Chief Justice, 1900–07, and Governor, 1907–13, of Hawaii Former Vice-President, Bishop Trust Company, Honolulu, Hawaii Author of *Evolution of the Hawaiian Judiciary;* etc.

**W. F. K.—Winifred F. Knox.** Author of *The Court of a Saint.*

**W. F. L.—Walter Firth Lanterman.** Engineer, National Broadcasting Company, Chicago, Ill.

**W. F. M.—William Frederick Meggers.** Chief Spectroscopy Section, National Bureau of [illegible] D C.

**W. Fo.—Wolfgang Foerster.** Lieutenant Colonel, formerly of the General Staff, German Army Former Member of the Historical section of the General Staff Chief of the General Staff of the XI Corps, 1917 Author of *Prinz Friedrich Karl von Preussen; Graf Schlieffen und der Weltkrieg*

**W. F. P.—William F. Parish.** Consulting and lubricating engineer, New York Member, American Society of Mechanical Engineers, etc.

**W. F. R.—William Frank Rasche.** Director and Principal, Milwaukee Vocational School, Milwaukee, Wis.

**W. F. Re.—William Fiddian Reddaway.** Former Fellow of King's College, Cambridge, and University Lecturer. Censor of Fitzwilliam House, Cambridge Eng., 1907–24. Author of "[illegible] in the *Cambridge Modern History.*

**W. F. S.—William Fleetwood Sheppard.** Former Fellow of Trinity College, Cambridge Senior Examiner to the Board of Education.

**W. F. Sw.—W. F. Swann.** Technical Correspondent, Sales Service Division, Eastman Kodak Company, Rochester, N.Y.

**W. Ft.—Wesley Frost.** Former U.S Ambassador to Paraguay. Author of *German Submarine Warfare*

**W. F. W.—Walter Francis Willcox.** Emeritus Professor of Economics and Statistics, Cornell University, Ithaca, N.Y Special Agent of the U S Census Bureau, 1902–31. Author of *The Divorce Problem—a Study in Statistics;* etc.

**W. G.—William Green.** President of the American Federation of Labor, Washington, D.C.

**W. Ga.—Walter Garstang.** Former Professor of Zoology in the University of Leeds, England. Vice-President, Marine Biological Association, 1940.

**W. G. A.—Walter Gordon Armstrong.** Assistant to the President, Youngstown Pressed Steel Company, Warren, O.

**W. Gam.—W. Gamble.** Editor, *Penrose's Annual.*

**W. Gar.—W. Garnett.** Educational Advisor to the London County Council, 1904–15.

**W. G. B.—Walter George Bell.** Author of *The Great Fire of London in 1666; The Great Plague in London in 1665; Unknown London;* etc.

**W. G. C.—Walter Goodman Cowles.** Former Vice-President, Travelers Insurance Company, Hartford, Conn.

**W. G. D.—William G. Downey, Jr.** Major, U S Army Chief, International Law Branch, Office of the Judge Advocate General. Author of *American Maritime Neutrality Policy; Revision of the Rules of Warfare.*

**W. Gr.—Sir Wilfred T. Grenfell, M.D.** Author of *An Autobiography of a Labrador Doctor;* etc.

**W. G. M.—Walter George McMillan.** Former Secretary of the Institute of Electrical Engineers and Lecturer on Metallurgy, Mason College, Birmingham. Author of *A Treatise on Electro-Metallurgy.*

**W. G. P.—Wibo G. Peekema.** Legal Adviser, Standard-Vacuum Petroleum Co.

**W. Gr.—William Graham.** Former M P. for the Central Division of Edinburgh. Financial Secretary to the Treasury, 1924.

**W. G. R.—Will G. Robinson.** Secretary, South Dakota State Historical Society. Author of *South Dakota in World War II.*

**W. Gs.—Walter Adolph Gropius.** Senior Professor of Architecture and Chairman of School of Architecture, Harvard University.

**W. G. W.—William Gillies Whittaker.** Gardiner Professor of Music, Glasgow University, and Principal, Scottish National Academy of Music, 1930–41

**W. G. Wt.—William G. Watt.** Director, Division of Maritime Security, U S. Navy Hydrographic Office, Washington, D.C.

**W. H.—Sir (Thomas) Wolseley Haig.** Lieutenant Colonel Former Lecturer in Persian, School of Oriental Studies, University of London. H B M.'s Consul-General and Agent to the Government of India, Khurasan, Persia, 1914–16; Isfahan, 1916, Tehran, 1919. Co-editor of the *Cambridge History of India.*

**W. Ham.—Walter Hampden.** Actor manager.

**W. H. B.—William H. Burnham.** Former Professor of Education and School Hygiene, Clark University, Worcester, Mass. Author of *The Normal Mind; Great Teachers and Mental Health.*

**W. H. Ba.—W. H. Balzer.** Research Engineer, Staff of Ansonia Clock Company, Brooklyn, N.Y.

**W. H. Bau.—William H. Baumer.** Lieut. Col. Plans and Operations Division, General Staff, Department of the Army, Washington, D C.

**W. H. Be.—William Henry Bennett, D.D.** Former Professor of Old Testament Exegesis in New and Hackney Colleges, London. Author of *Religion of the Post Exilic Prophets;* etc.

**W. H. Bl.—Walter Harold Blucher.** Executive Director, American Society of Planning Officials. Lecturer in Planning, The University of Chicago, Chicago, Ill.

**W. H. By.—Wilmot Hyde Bradley.** Chief Geologist, U.S. Geological Survey, Washington, D.C.

**W. H. Ca.—Willis Haviland Carrier.** Former President, American Society of Heating and Ventilating Engineers. Co-author and editor, *Fan Engineering.*

**W. H. Ch.—William Henry Chamberlin.** American correspondent for the *Christian Science Monitor* in France, 1939– , in the Soviet Union, 1922–34, the Far East, 1935–38 Author of *Soviet Russia; Russia's Iron Age; Japan Over Asia;* etc.

**W. H. Cl.—Sir William Henry Clark.** Former Director of Barclay's Bank, etc. Comptroller-General of Department of Overseas Trade, 1918–28. High Commissioner in Union of South Africa for H.M. Government in United Kingdom, 1934–39.

**W. H. Cr.—Walter Hill Crockett.** Former Editor of Publications, University of Vermont, Burlington, Vt.

**W. H. Dr.—William Hamilton Drummond, D.D.** Honorary President Manchester College, Oxford, 1938–42 Secretary of the International Congress of Free Christians and other Religious Liberals, 1920–29.

**W. H. D. R.—William Henry Denham Rouse.** University Teacher of Sanskrit, Cambridge University, 1903–39; Head Master Perse Grammar School, Cambridge 1902–28. Author of *Latin on the Direct Method.*

**W. H. F.—Rt. Rev. Walter Howard Frere, D.D.** Bishop of Truro, 1923–35. Examining Chaplain to the Bishop of Southwark, 1895–1909. Author of *The Marian Reaction; Sursum Corda;* etc.

**W. H. H.—Sir William Henry Hadow.** Vice-Chancellor, University of Sheffield, England, 1919–30. Former Member of Council, Royal College of Music Editor, *Oxford History of Music.* Author of *Studies in Modern Music; Sonata Form;* etc.

**W. H. Ha.—William Henry Hargrove.** Emeritus Professor of Rural Education, Colorado State College of Education, Greeley, Colo.

**W. H. Hs.—William Herman Haas.** Emeritus Professor of Geology and Geography, Northwestern University College of Liberal Arts, Evanston, Ill. Author of *The South American Indian*

**W. H. Is.—William Harold Ingrams.** Adviser on Overseas Information to Secretary of State for the Colonies. Author of *Arabia and the Isles; Hong Kong.*

**W. H. J.—Willis Hugh Johnson.** Professor of Zoology and Chairman of Department of Zoology, Wabash College, Crawfordsville, Ind.

**W. H. Jn.—Walter Henry Johnston.** Assistant Editor, *Yorkshire Post,* Leeds, Eng.

**W. H. K.—William H. Kobbé.** Director, Kobbé Laboratories, Inc., New York, N.Y.

**W. H. Kn.—William H. Kern.** OIC, Planning and Operations Section, U.S. Army Pigeon Service Agency.

**W. H. La.—William Henry Lawrence.** Emeritus Professor, Architectural Engineering, Massachusetts Institute of Technology, Cambridge, Mass. Curator and member of faculty of Lowell Institute, Boston, Mass. Author of *Principles of Architectural Perspective.*

**W. H. Le.—W. H. Leffingwell.** Author of *Scientific Office Management;* etc.

**W. H. L. W.—William Henry Lowe Watson.** Author of *A Boy's Book of Prose; Tales from English History;* etc.

**W. H. M.—William Henry Maxwell.** Borough and Waterworks Engineer, Tunbridge Wells, England. Former President Institute of Sanitary Engineers, London. Author of *Removal and Disposal of Refuse.*

**W. H. Ma.—William Herrick Macaulay.** Former Fellow and Tutor of King's College, Cambridge Author of *The Law of Thermodynamics;* etc.

**W. H. Mi.—William Hobson Mills.** Emeritus Reader in Stereochemistry and Fellow and President [illegible] lege, Cambridge. President Chemical Society, 1941–43.

**W. H. Mk.—Walter Heinrich Munk.** Associate in Oceanography, Scripps Institution of Oceanography, University of California, La Jolla, Calif.

**W. Hn.—Wilder Hobson.** Author of *American Jazz Music.*

**W. H. N.—W. H. Nalder.** Chief Designing Engineer, U.S. Bureau of Reclamation, Denver, Colo.

**W. Ho.—William Hodson.** Commissioner of Public Welfare, New York City, 1934–43.

**W. H. O.—Wilfred H. Osgood.** Former Curator of Zoology, Chicago Natural History Museum, Chicago, Ill.

**W. H. P.—Wallace H. Paull.** Technical Director of the Dunlop Rubber Co, Ltd., Birmingham, England.

**W. H. P. F.—William H. P. Faunce, D.D.** Former President of Brown University, Providence, R I Former President, World Peace Foundation Author of *The Educational Ideal in the Ministry;* etc

**W. H. Po.—Walter Herries Pollock.** Editor of *Saturday Review,* 1883–94 Author of *Lectures on French Poets;* etc.

**W. Hr.—William Holtzheuer.** Of the Continental Caoutchouc and Gutta Percha Company, Hanover, Germany.

**W. H. R.—Worth Huff Rodebush.** Professor of Physical Chemistry, University of Illinois, Urbana, Ill. Author of *Physical Chemistry.*

**W. H. S.—W. Howard Sadgrove.** Managing Director of Messrs Sadgrove & Co, Ltd, Furniture Manufacturers and Upholsters, London.

**W. H. Sa.—William Henry Salter.** Treasurer and Joint Honorary Secretary, Society for Psychical Research, London

**W. H. Sie.—William Henry Siebert.** Secretary and Director, Hammacher Schlemmer and Company, Inc., New York, N Y.

**W. Ht.—Willard Hurst.** Professor of Law, University of Wisconsin, Madison, Wis. Author of *The Growth of American Law: the Law Makers.*

**W. H. T.—William H. Taliaferro.** Eliakim Hastings Moore Distinguished Service Professor of Parasitology and Chairman of the Department [illegible] and Parasitology, The University of Chicago. Author of *Immunology of Parasitic Infections;* etc.

**W. H. Te.—William Homan Thorpe.** Fellow of Jesus College, Cambridge. Lecturer in Entomology in the University, Cambridge University.

**W. H. Tl.—William H. Twenhofel.** Research Consultant, Magnolia Petroleum Co. Co-author of *Invertebrate Paleontology; Principles of Sedimentation.*

**W. H. U.—William H. Ukers.** Former Editor, *The Tea and Coffee Trade Journal.* Author of *All About Coffee; All About Tea;* etc.

**W. H. Wh.—William Henry Wheeler.** Director, Projectile Development, Ministry of Supply, Eng.

**W. H. Wi.—Sir William Henry Willcox, M.D.** Colonel. Medical Adviser to Home Office, 1919–41. Physician, Lecturer on Chemical Pathology and on Forensic Medicine, St. Mary's Hospital, London, 1900–35.

**W. H. Wo.**—**William H. Woodcock.** Member of the Society of Public Analysts

**W. H. Wr.**—**William Hammond Wright.** Director (1935–42) and Emeritus Astronomer, Lick Observatory University of California. In charge of the Lick Observatory's Expedition to the Southern Hemisphere, 1903–06

**W. H. Wt.**—**Willard Hull Wright.** Scientist Director (Colonel), U S Public Health Service. Chief, Division of Tropical Diseases, National Institutes of Health, Bethesda, Md.

**W. I.**—**Will Irwin.** Author of *Youth Rides West; Propaganda and the News;* etc

**Wi. H.**—**Wilfried Heller.** Research Associate and Lecturer in Colloid Chemistry, The University of Chicago Author of *Nouvelles Recherches sur Les Propriétés Magneto-Optiques des Solutions Colloidales*, etc

**W. I. J.**—**William Ivor Jennings.** Vice-Chancellor, University of Ceylon. Author of *Cabinet Government; Parliament*

**W. I. K.**—**Willford Isbell King.** Professor of Economics, New York University School of Commerce Author of *The Wealth and Income of the People of the United States;* etc.

**Wi. Mr.**—**William Miller.** Editor, Alfred A Knopf, Inc, New York, N Y Author of *The Age of Enterprise: a Social History of Industrial America.*

**W. J.**—**W. Jutzi.** Dyeworks and Chemical Industries Amalgamation, Ludwigshafen, Germany.

**W. J. B.**—**Sir William John Berry.** Director of Naval Construction, Admiralty, 1924–30. Director of Warship Production, 1917–23.

**W. J. Bg.**—**Wilfred Joseph Bigg.** Head of the Communications Department, Colonial Office, London.

**W. J. Bp.**—**William John Bishop.** Librarian, Wellcome Historical Medical Library, London. Co-author of *Notable Names in Medicine and Surgery.*

**W. J. Br.**—**Rev. William Jackson Brodribb.** Former Fellow of St. John's College, Cambridge.

**W. J. Ch.**—**William Joseph Chipman.** Former Football Editor, New York *Daily News,* New York, N Y.

**W. J. D.**—**William John Dakin.** Former Professor of Zoology, University of Sydney, Australia Former Professor of Biology in the University of Western Australia. Author of *Textbooks on Zoology;* etc.

**W. J. Do.**—**William John Donald.** Managing Director, National Electrical Manufacturers Association, New York, N.Y. Author of *Canadian Iron and Steel Industry; Trade Associations;* etc. Editor in Chief, *Handbook of Business Administration.*

**W. J. Don.**—**William Joseph Donovan.** Major General, U.S.A. Co-ordinator of Information and Director of Strategic Services, Washington, D.C U S. Commissioner and Chairman, Colorado River Commission.

**W. J. E.**—**W. J. Everard.** Director of F. T. Everard and Sons, Ltd.

**W. J. E. B.**—**William James Eames Binnie.** Consulting Engineer, Senior Partner of firm of Binnie, Deacon and Gourley, London. President of Institution of Civil Engineers, 1938–39.

**W. J. Et.**—**Wallace John Eckert.** Professor of Celestial Mechanics, Columbia University, New York, N Y Author of *Punched Card Methods in Scientific Computation.*

**W. J. F.**—**William J. Filbert.** Former Director and Chairman of Finance Committee. United States Steel Corporation, New York, N Y.

**W. J. Gru.**—**William John Gruffydd.** Emeritus Professor of Celtic, University College of South Wales and Monmouthshire, Cardiff, Wales Author of *History of Welsh Literature (1450–1600); History of Welsh Prose (1540–1660);* etc.

**W. J. H.**—**William James Hughan.** Past-Senior Grand Deacon of [illegible] of England, 1874 Honorary Senior Warden of Grand Lodges of Egypt, Quebec and Iona

**W. J. Hs.**—**William Jackson Humphreys.** Retired government scientist Author of *Physics of the Air; Ways of the Weather;* etc.

**W. J. J.**—**William Jackson Jenks.** Chairman of the Board, Norfolk & Western Railway Company

**W. J. L.**—**William John Loeffel.** Professor of Animal Husbandry and Chairman, Animal Husbandry Department, Univ. of Nebraska, Lincoln, Neb

**W. J. Lu.**—**Rev. William J. Lallou, S.T.D.** Associate Professor of Sacred Liturgy, Catholic University of America, Washington, D C

**W. J. M.**—**William John McCallien.** Professor of Geology, University College of the Gold Coast, Achimota, Gold Coast. Author of *Geology of the Glasgow District; Scottish Gemstones.*

**W. J. Ry.**—**W. J. Rooney.** Physicist, Carnegie Institution of Washington, Department of Terrestrial Magnetism

**W. J. T. H.**—**W. J. T. Halliwell.** Former Principal Pilotage Clerk, Trinity House, London.

**W. K.**—**Wolfgang Köhler.** Professor of Psychology, Swarthmore College, Swarthmore, Pa., 1935– . Author of *The Mentality of Apes; The Place of Value in a World of Facts;* etc.

**W. K. G.**—**William King Gregory.** Emeritus Curator of the Department of Comparative Anatomy and Department of Ichthyology, American Museum of Natural History, New York Emeritus Professor of Vertebrate Palaeontology, Columbia University. Author of *The Orders of Mammals;* etc.

**W. K. L. C.**—**William Kemp Lowther Clarke, D.D.** Canon Residentiary of Chichester Cathedral, 1945– . Editorial Secretary of Society for Promoting Christian Knowledge, 1915–44. Author of *St. Basil the Great;* etc.

**W. K. McC.**—**Sir William Kidston McClure.** Former Counsellor, British Embassy, Rome Former correspondent of *The Times* (London) in Rome War Correspondent of *The Times* on the Italian Front, 1915–17. Author of *Italy's Part in the War;* etc.

**W. Kt.**—**Waldemar Kaempffert.** Science Editor, the *New York Times.* Author of *Explorations in Science; History of Astronomy; Popular History of American Invention; Science Today and Tomorrow.*

**W. L.**—**Walter Landells.** London Stock Exchange.

**W. La.**—**William Latey.** Of the Middle Temple, and the Probate and Divorce Courts, Barrister-at-Law

**W. L.** [illegible] **Ayers.** Former Director [illegible], International Bank for Reconstruction and Development, Washington, D C

**W. L. B.**—**William Lewis Blennerhassett.** Former Acting British Vice-Consul at Kovno, Lithuania Member of the London Stock Exchange.

**W. L. Bd.**—**William Leslie Bradford, M.D.** Associate Professor of Pediatrics and Assistant Dean, University of Rochester School of Medicine and Dentistry, Rochester, N Y.

**W. L. Bn.**—**William Laurence Burn.** Professor of Modern History, King's College, University of Durham, Newcastle-upon-Tyne, Eng. Author of *The British West Indies; Emancipation and Apprenticeship in the British West Indies.*

**W. L. D.**—**Wilfred L. Denno.** Warden of Sing Sing Prison, Ossining, N Y.

**W. L. de B.**—**William Lane de Baufre.** Chairman, Department of Engineering Mechanics, University of Nebraska, Lincoln, Neb.

**W. L. F.**—**Walter Lynwood Fleming.** Former Dean, College of Arts and Sciences, Vanderbilt University, Nashville, Tenn Author of *Documentary History of Reconstruction.*

**W. L. Fk.**—**William L. Frederick.** Research Associate, Council of State Governments.

**W. L. G.**—**William Lawson Grant.** Former Principal of Upper Canada College, Toronto Beit Lecturer in Colonial History at Oxford University, 1906–10 Professor of Colonial History, Queen's University, Kingston, Canada, 1910–15 Editor of *Acts of the Privy Council, Canadian Constitutional Development* (in collaboration).

**W. L. Gn.**—**W. Lashford Griffin.** Director of Messrs William Griffin and Sons, Ltd., Chain Manufacturers, Cradley Heath, Staffs., England.

**W. L. H. D.**—**Wynfrid Laurence Henry Duckworth, M.D.** Master of Jesus College, Cambridge, 1940–45; Reader in Human Anatomy, 1920–40.

**W. Li.**—**Walter Lippmann.** Special Writer, *New York Herald Tribune.* Former Editor of *New York World.* Author of *Liberty and the News;* etc.

**W. L. J.**—**William L. Jellison.** Sanitarian, United States Public Health Service, Rocky Mountain Laboratory, Hamilton, Mont.

**W. L. P.**—**William Lyon Phelps, D.D.** Lampson Professor of English Literature, Yale University, 1901–33 Author of *Some Makers of American Literature;* etc.

**W. L. R.**—**William L. Rodgers.** Vice-Admiral, U S N. Commander in Chief of the United States Asiatic Fleet, 1918–19.

# ENCYCLOPÆDIA BRITANNICA

*A NEW SURVEY OF UNIVERSAL KNOWLEDGE*

## Volume I

## A to ANNOY

A THIS letter has stood at the head of the alphabet during the whole of the period that it can be traced historically. The name of the letter in the Phoenician period resembled the Hebrew name *aleph* and was taken over by the Greeks in the form of *alpha*. In the Phoenician alphabet the letter stood for a species of breathing or inherent sound, since vowels were not represented in the Semitic alphabets. The view that the Greeks received their alphabet directly from the Phoenicians has now been largely abandoned. The character may therefore have stood for a vowel in the alphabet before the Greeks took it over. It must indeed almost certainly have done so if it was in use among the peoples of Asia Minor previous to its use by the Greeks. Throughout its history variations have occurred in the form of the letter. The Phoenician form was . In the Lydian alphabet of the fifth century B.C. it appeared as  , in the Carian alphabet  or  . In the early Greek alphabet from the island of Thera, which may possibly be dated as far back as the eighth or ninth century B.C., its form was  or  . In the Greek alphabet of classical times its form was usually . Early Italian and Latin forms are  and . As early as the middle of the second century A.D. we find  as a form of , and this is the ancestor of our present minuscule printed a by way of uncial  (fourth century) and  (eighth century), uncial writing being the name given to the round hand which in late Roman times superseded the square capitals that had been suitable for inscription in stone. Under the influence of the uncial hand this form was adopted into Carolingian minuscules. Our rounded minuscule *a* derives from Latin cursive, in which in the fifth century A.D. appears the astonishing form . This is a hastily-written majuscule  distorted by its apex having fallen to the left. In the sixth century the cursive form was , and from this in the seventh century develops the form , from which the rounded form of the Irish and early English hands grew. The rounded capital  that sometimes appears in handwriting is the minuscule letter written large.

The sound for which the letter consistently stood in Greek and Latin, and doubtless, generally speaking, in its immediate pre-Greek history, was the open low back vowel, usually known in modern English as continental *a*. There are of course countless slight variations in the method of pronouncing this sound. In English the sound has undergone far-reaching changes during and since the Middle English period. These are due to *fronting*, that is to say, pronouncing the sound more towards the front of the mouth, or to *rounding*, slightly rounding the lips, which has the effect of causing the sound to be pronounced higher in the mouth. At the present time the letter represents six principal vowel-sounds: (1) its original value, the low back vowel, as in *father*,

(2) an intermediate vowel, as in *man;* (3) a closer vowel, further fronted, as in *hare,* occurring only before the liquid *r;* (4) a diphthong (*ei*) as in *take, spade.* This is the sound that the letter now normally represents when the vowel is long. (3) represents a stage in the development of the sound on its way from (1) to (4) which was arrested at this point when the vowel was followed

| NAME OF FORM | APPROXIMATE DATE | FORM OF LETTER |
|---|---|---|
| PHOENICIAN | B.C. 1,200 |  |
| CRETAN | 1,100-900 |  |
| THERAEAN | 700-600 |  |
| ARCHAIC LATIN | 700-500 |  |

| OSCAN | |  |
| UMBRIAN | |  |
| CLASSICAL LATIN AND ONWARDS | |  |

THE DEVELOPMENT OF THE LETTER A FROM PHOENICIAN TIMES, THROUGH CLASSICAL GREEK AND LATIN, TO THE PRESENT DAY

by *r.* A similar fronting of this sound took place in the Ionic-Attic dialects of Greek, where sounds derived from the *a*-sound and represented in other dialects by *a* are represented by *η*.

The two remaining developments of the sound are due to rounding: (5) the vowel of *water* and (6) the vowel of *was.* This development is due to the influence of the preceding bilabial spirant *w.*

(B. F. C. A.)

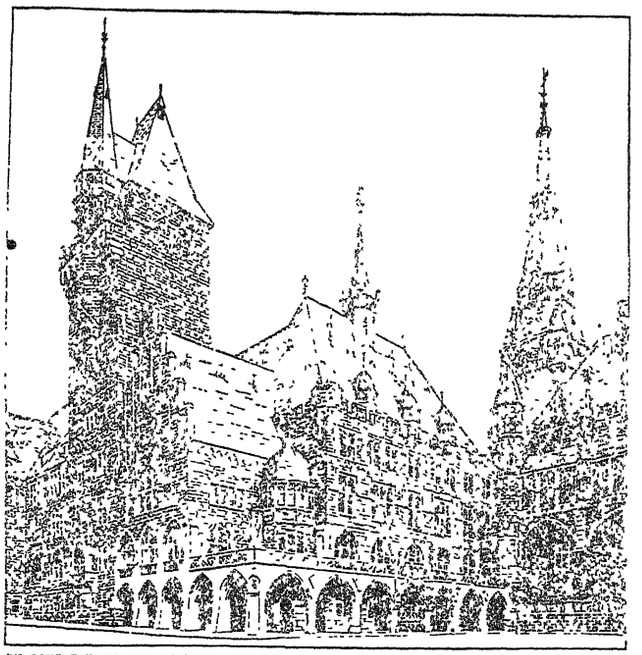
*In Music,* A is the name of the first note of the musical alphabet and constitutes the 6th degree of the scale of C. In respect of pitch A=435.4 vibrations per second, this being the standard pitch or *diapason normal.* A is the note always given to orchestral players, usually by the oboe, for tuning purposes.

(*See* PITCH, MUSICAL.)

**A1 AT LLOYD'S,** a popular expression denoting super-excellence, derived from the prestige of the world's chief shipping registry, Lloyd's Register of British and Foreign Shipping. In fact, the highest classification assigned to iron and steel ships is "100 A1." In this symbol, "100 A" denotes the condition of the hull, while the "1" denotes efficiency of equipment. "A1" is almost obsolete, being the symbol of the highest classification of wooden vessels.

(*See* LLOYD'S REGISTER OF SHIPPING.)

**AA,** the name of many small European rivers. The word is derived from the O. G. *aha,* cognate to the Latin *aqua,* water (*cf.* Ger. *-ach;* Scand. *á, aa,* pronounced *ō*). Among the streams of this name are:—Two rivers in west Russia, falling into the Gulf of Riga with Riga lying between their mouths; a river in northern France flowing through St. Omer and Gravelines, and a river of Switzerland, in the cantons of Lucerne and Aargau, which carries the waters of Lakes Baldegger and Hallwiler into the Aar. In Germany there are the Westphalian Aa, joining the Werre at Herford, the Münster Aa, a tributary of the Ems, and others



AABENRAA, a town of Denmark, in Aabenraa *amt,* at the head of Sleswig bay, being an arm of the Little Belt. It has a good harbour and a large carrying trade. Pop. (1950) 13,017. From 1864 to 1919 it was in the German province of Schleswig.

**AACHEN** (Fr. AIX-LA-CHAPELLE; Dutch AKEN), ancient city and spa, North Rhine-Westphalia, Ger., under the northern slopes of the Ardennes, on the Cologne-Brussels main line, 44 mi. W. by S. of Cologne. Pop. (1950) 129,811. Its municipal boundaries coincide on the west with the frontiers of Belgium and the Netherlands. In general appearance a prosperous, modern commercial town, it is full of mediaeval associations. The outer town is mainly new; while the ramparts of the old inner town are now promenades, with two ancient gates, Ponttor and Marschiertor, remaining. The hot sulphur springs have been celebrated for centuries. The conspicuous cluster of buildings in the centre of the city includes the cathedral and the Rathaus (town hall), a Gothic structure (1353–70) built on the ruins of Charlemagne's palace, which contains the magnificent coronation hall of the emperors (143 ft. by 61 ft.). The two original towers, Granusturm and Glockenturm, were all but destroyed by fire in 1883; their restoration was completed in 1902. Near the Rathaus is the Grashaus, restored in 1889 to house the municipal archives. The cathedral is in two distinct styles. The Romanesque *Octagon,* begun in 796, the finest extant Carolingian structure, was modelled on San Vitale at Ravenna, and consecrated by Pope Leo III in 805. Emperor Otto III rebuilt it, on the original lines, in 983, after its destruction by Norman raiders. It is surrounded on the first story by a gallery (the Hochmünster) with antique marble and granite columns, of various sizes, brought from Rome, Ravenna and Trier, removed by Napoleon to Paris, but restored after 1815. The mosaic representing Christ surrounded by "the four-and-twenty elders," which originally lined the cupola, was executed in 1881 from a 17th century copy of the ancient originals The bronze west doors date from 804. Underneath the dome, tradition places the tomb of Charlemagne, said to have been opened by Otto III in 1000 and to have shown the emperor's body on a marble chair which was removed and long used for coronations. It is now in the gallery. The site of the tomb is marked by a stone slab, with the inscription *Carlo Magno,* and above it hangs the famous bronze chandelier presented by the emperor Barbarossa in 1168. In the Hungarian chapel, to the south-west, is the rich Cathedral Treasury, with fine mediaeval work such as the 13th century gold casket containing the relics of Charlemagne. The Gothic choir was added during the 14th and 15th centuries and contains the tomb of the emperor Otto III. The pulpit, a gift of emperor Henry II., dates from *c.* 1020. The cathedral possesses many relics, the more sacred of which are exhibited only once every seven years, when they attract large crowds.

The churches of St. Foillan (founded in the 12th century, but twice rebuilt, in the 15th and 17th centuries, and restored in 1883) and St. Paul, with its beautiful stained-glass windows, are interesting. The Suermondt museum contains fine pictures by early German, Dutch and Flemish masters. There are many fine streets, squares and public monuments. The fountain in the market square is surmounted by a statue of Charlemagne. In the principal square, Friedrich-Wilhelmplatz, is the Elisenbrunnen, with its colonnade and garden, the chief resort of visitors taking the baths and waters.

Since the working of extensive coalfields in the district almost every branch of iron industry has been carried on. Cloth, glass, needles and pins are important products. The suburb of Burtscheid, incorporated with Aachen in 1897, has old-established manufactures of cloth and needles and contains, among frequented thermal springs, the Schwertbad-Quelle (171°F.), the warmest spring in Germany.

**History.**—The ancient city and watering place of Aachen represents the Aquisgranum of the Romans, named after Apollo Granus, who was worshipped in connection with hot springs. As early as A.D. 765 King Pippin had a "palace" there, in which it is probable that Charlemagne was born. The greatness of Aachen was due to the latter, who between 777 and 786 built a magnificent palace on the site of that of his father, raised the place to the rank of the second city of the Empire, and made it for a while the centre of Western culture and learning. From the coronation of Louis the Pious in 813 until that of Ferdinand I. in 1531 the sacring of the German kings took place at Aachen; as many as 32 emperors and kings were crowned there. Late in the 12th century (1172–76) the city was surrounded with walls by order of the emperor Frederick I., to whom (in 1166)

BY COURTESY OF REICHSZENTRALE FUR DEUTSCHE VERKEHRSWERBUNG

THE RATHAUS OR TOWN HALL AT AACHEN, ERECTED IN 1353–70 ON THE SITE OF THE PALACE OF THE EMPEROR CHARLEMAGNE

and to his grandson Frederick II. (in 1215) it owed its first important civic rights. In the 16th century Aachen began to decline.

It lay too near the French frontier to be safe, and too remote from the centre of Germany to be convenient, as a capital; and in 1562 the election and coronation of Maximilian II. took place at Frankfort-on-Main, a precedent followed till the extinction of the Empire. In 1815 it was given to Prussia. In Nov. 1918, at the conclusion of World War I, Aachen was occupied for a period by Belgian troops.

During World War II, because of its important aerodrome and railway connections, it was bombed many times by the Allies.

**AAHMES:** *see* AMASIS.

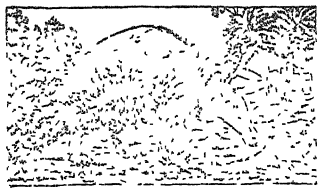
**AAL,** also known as A'L, ACH, or AICH, the Hindustani names for the *Morinda tinctoria* and *Morinda citrifolia,* plants extensively cultivated in India on account of the reddish dye-stuff which their roots contain. The name is also applied to the dye, but the common trade name is *Suranji.* Its properties are due to the presence of a glucoside known as *Morindin,* which is compounded from glucose and probably a trioxy-methyl-anthraquinone.

**AALBORG,** seaport on the south bank of the Limfjord, North Jutland, Denmark, capital of Aalborg *amt,* and one of Denmark's oldest towns. Pop. (1940), 55,652. It is the seat of a bishop (1554) and has some old buildings, Jens Bangs Stenhus, the castle called Aalborghus, the Holy Ghost monastery and the Budolfi church. The municipal privileges date from 1342. Industries include cement works, tobacco works, distilleries, chemical works (sulphuric acid and superphosphate), cloth mills and the ship yard.

**AALEN,** a town in Württemberg, Germany, situated on the Kocher, a tributary of the Neckar, at the foot of the Swabian Alps, about 50m. E. of Stuttgart. Pop. (1939) 16,003. Woollen and linen goods and ribbons are manufactured, and there are tanneries and large iron works. Aalen was a free imperial city from 1360 to 1802, when it was annexed to Württemberg.

**AALESUND** (or ÅLESUND), seaport of Norway, in Møre fylke (county), 160 mi. N. by E. of Bergen by sea. Pop. (est. 1936) 18,350. It is built on three islands, Nørvø, Aspø and Hissen, enclosing the harbour. Founded in 1824, Aalesund is an important export town for fish and fish products. It lies in a very productive fishing district; to the northwest lie the great cod-banks of Storeggen and Nyeggen. Vessels also fish off Iceland, while a fleet of sealing boats is sent to the Arctic ocean. There are numerous factories connected with the fish industry and oil refineries, engineering works and a seining factory. Aalesund is ordinarily a port of call for the Norwegian South American line (on account of the export of klip-fish) and for the routes Trondhjem–Hamburg, Trondhjem–France and Trondhjem–England, and also for most coasting vessels trading in western Norway. There is some [illegible] connected with the adjacent centres of Geiranger and Jørund fjords. In 1904 Aalesund was wasted by a terrible fire. In the following years the town was planned on new lines and the houses in the centre were built of brick. German troops occupied Aalesund in 1940.

**AALI MEHEMET,** PASHA (1815–1871), Turkish statesman, was born at Constantinople, the son of a government official. He was ambassador in London (1842–45), and then foreign minister under Reshid Pasha. He took part in the congress of Vienna (1855) and in the congress of Paris (1856), and was five times grand vizier. Aali Pasha was one of the most zealous advocates of the introduction of Western reforms under the Sultans Abdul-Mejid and Abdul-Aziz. He died at Erenkoi in Asia Minor on Sept. 6, 1871.



**AALSMEER,** a town in the province of North Holland, Holland, situated in low country about 10 mi. S.W. of Amsterdam. Pop. (1940) 10,420. It has railway communication with Haarlem and Utrecht. The flat country with its fertile sandy soil, which can be easily watered, provides ideal conditions for horticulture, and the town is surrounded by flower gardens and plant nurseries. Large quantities of plants, bulbs and blooms are exported annually. Aalsmeer was taken by Germany in May 1940.

**AAR** or **AARE,** the largest river entirely within Switzerland. It rises in the great Aar glaciers, in the canton of Berne, west of the Grimsel pass. Beyond the Handegg waterfall the river traverses the Hasli Thal and expands into the Lake of Brienz, where it becomes navigable. It then crosses the swampy plain of the Bödeli, between Interlaken (left) and Unterseen (right), before again expanding into the Lake of Thun. Running north-north-west it encircles the lofty bluff on which the town of Berne is built, and then turns west, and later north. Near Aarberg its stream is diverted west by the Hagneck canal into the Lake of Bienne whence the Nidau canal runs east to Büren. Henceforth its long north-east valley drains the central lowland of north Switzerland, parallel to the Jura. The chief tributaries in this stretch are the Grosse Emme, Wigger, Suhr and Aa, all from the right. Below Brugg it receives first the Reuss, and then the Limmat or Linth. It now turns due north, and soon becomes itself an affluent of the Rhine (left), which it surpasses in volume when they unite at Coblenz, opposite Waldshut. Length of river, 181m. Area of basin, 6,804sq.m.

**AARAU,** the capital of the Swiss canton of Aargau. Pop. (1930), 11,666, mostly German-speaking Protestants. It is on the right bank of the Aar at the southern foot of the Jura, about 50m. by rail north-east of Berne, and 31m. north-west of Zürich An ancient fortress, it was taken by the Bernese in 1415, and in 1798 became for a time the capital of the Helvetic republic.

Eight miles by rail north-east are the famous sulphur baths of Schinznach, near which is the ruined castle of Habsburg, the original home of that house. Industries include silk-ribbon weaving, foundries, cutlery, electrotechnical products and scientific instruments. Aarau is an important military centre.

**AARDVARK** (ard'vark), "earth-pig," the Dutch name for ant-eating mammals of the genus *Orycteropus*, confined to Africa (*see* EDENTATA). The typical form is *O. a. afer*, or Cape-ant-bear from South Africa; other races are found northward, both in forest and plains country to Senegal and the Sudan. The body is stout, with arched back; the limbs are short and stout, armed with strong, blunt claws; the ears long; and the tail thick at the base and tapering gradually. The elongated head is set on a short thick neck, and at the extremity of the snout is a disc in which the nostrils open. The mouth is small and tubular, furnished with a long extensile tongue. A large individual measured 6 ft. 8 in. In colour the Cape aardvark is pale sandy or yellow, the hair being scanty and allowing the skin to show; the northern aardvark has a still thinner coat, a shorter tail and longer head and ears. These animals are nocturnal and burrowing. The strong claws make a hole in the side of the anthill, and the insects are collected on the extensile tongue.

THE CAPE AARDVARK OR ANTEATER OF AFRICA WHICH GROWS USUALLY TO A LENGTH OF ABOUT 5 FT.

**AARDWOLF** (earth-wolf), a South and East African carnivorous mammal (*Proteles cristatus*), like a small striped hyena, but with a more pointed muzzle, sharper ears and a long erectile mane. It is burrowing in habit and feeds on termites.

**AARGAU**, a canton of north Switzerland, comprising the lower course of the River Aar (*q.v.*), whence its name. Its total area is 548 sq mi. It forms the northeastern section of the great Swiss plateau which occupies the trough between the Alps and the Jura. Its fertile valleys alternate with pleasantly wooded hills.

In 1415 the Aargau region, previously the centre of the Habsburgs, was taken from them by the Swiss Confederates. Berne kept the southwest portion. In 1798 the Bernese part became the canton of Aargau of the Helvetic republic and the remainder of the Aargau region formed the canton of Baden. In 1803 the two halves (plus the Frick glen, ceded in 1802 by Austria to the Helvetic republic) were united under the name of Canton Aargau and admitted to membership in the Swiss confederation.

The population of the canton in 1941 was 269,873, almost exclusively German-speaking, with Protestants predominating. The canton, the capital of which is Aarau (*q.v.*), is governed by an executive council of five elected by direct vote. Principal industries include silk-ribbon weaving, electro-technique production and the production of tobacco and wines. Baden (*q.v.*), an important city of the canton, has a tourist industry dependent on its hot sulphur springs. The canton sends 12 members (on the basis of the 1941 census) to the federal *Nationalrat*.

**AARHUS**, seaport and second city of Denmark, capital of Aarhus amt, east coast of Jutland, on Aarhus bay. Pop. (1940) 99,881. It is first mentioned as a town in the 12th century, since when, at least, it has been the seat of a bishop. The town's first charter is dated 1441. Aarhus has a large harbour of three basins. It is the shipping and commercial centre for Jutland and is also known for its iron and oil industries. The district is low-lying, fertile and well wooded.

**AARON**, the traditional founder and head of the Jewish priesthood, who, in company with Moses, led the Israelites out of Egypt (*see* EXODUS, THE; MOSES). His association with Moses in this matter goes back to an ancient tradition, current in northern Israel, though the records derived from the south do not seem to mention him till after the Exile.

In the earlier narratives of the Pentateuch Aaron is mentioned in connection with four events only, (*a*) the Exodus itself, where he appears as the companion of Moses, (*b*) as supporting Moses at the battle of Rephidim, (*c*) as the maker of the golden calf (*see* CALF, THE GOLDEN) and (*d*) as rebelling, along with his sister Miriam, against the authority of Moses, on the ground that the latter had married a foreign wife (Num xii). It may be conjectured that his name did not occur in the original story from which the narrative of Ex. xxxii. was ultimately derived, but as it stands the passage suggests—as does also (*d*)—that there was a tradition of hostility between Moses and Aaron, rather than one of association.

Throughout the period of the monarchy (at least since the death of David) and even in Ezekiel, the legitimate priests at Jerusalem belong to the house of Zadok. It is only after the Exile that Aaron takes his place. In the whole of the sacerdotal literature, commonly ascribed to P, Aaron stands by the side of Moses. The latter is the representative of the secular power of Yahweh, Aaron is his religious vice-gerent. Thus he takes a share in producing the plagues in Egypt, stands by his brother's side (in the pre-exilic narratives he is called the brother of Miriam, but not of Moses) by the Red sea, wields the sacred rod, is chosen and miraculously vindicated as high priest, and is made the centre of the whole ritual system.

The process by which tradition changed Aaron from being a possible rival to Moses into his ecclesiastical counterpart, has never been satisfactorily explained. R. H Kennett has advanced the theory that the Aaronides were originally the priests of Bethel, and that their post-exilic position in Jerusalem was due to a compromise made during or shortly after the Exile This theory certainly offers an explanation of several difficulties, but there are others which it fails to meet, and hence it has not met with general acceptance. (T. H. R.)

**AARON'S ROD**, the popular name given to various tall flowering plants such as garden orpine, or live-for-ever, great mullein and goldenrod. In architecture the term is given to an ornamental rod with sprouting leaves, or sometimes with a serpent entwined round it (from the Biblical references in Exodus vii. 10 and Numbers xvii. 8).

**AARSSENS** or AARSSEN, **FRANCIS VAN** (1572–1641), Dutch diplomatist and statesman. Johan van Oldenbarneveldt sent him, at the age of 26 years, as a diplomatic agent of the States-General of the United Provinces to the court of France He helped to negotiate the 12 years' truce in 1606. Recalled from his post by Oldenbarneveldt in 1616, he was one of the "packed" court of judges who in 1619 condemned the aged statesman to death. For his share in this judicial murder a deep stain rests on the memory of Aarssens. He was confidential adviser on foreign affairs to Maurice, prince of Orange, and afterwards to Frederick Henry, and was sent on special embassies to Venice, Germany and England.

**AASEN, IVAR** (1813–1896), Norwegian philologist and lexicographer, was born at Aasen i Orsten, in Sondmore, Norway, Aug. 5, 1813. His first publication was a small collection of folk-songs in the Sondmore dialect (1843). The *Grammar of the Norwegian Dialects* (1848) and the *Dictionary of the Norwegian Dialects* (1850) prepared the way for the wide cultivation of the popular language in Norwegian, since Aasen really did no less than construct, out of the different materials at his disposal, a popular language or definite *folke-maal* for Norway. With certain modifications, this artificial language is that which has been adopted ever since by those who write in dialect and which later enthusiasts have endeavoured to impose upon Norway as her official language in the place of Dano-Norwegian. Aasen composed poems and plays in the composite dialect and continued to enlarge and improve his grammars and his dictionary Quite early in his career (1842) he had begun to receive a stipend to enable him to give his entire attention to his philological investigations, and the *Storting* treated him with more generosity as he grew older. Aasen holds perhaps an isolated place in literary history as the one man who has invented, or at least selected and constructed, a language which pleased so many thousands of his countrymen that they accepted it for their schools, their sermons and their songs. Aasen died in Christiania, Sept. 23, 1896.

**AASVOGEL**, the name by which the South African species of vultures (*q.v.*) are known. Literally it means "carrion-bird."

**AB,** the fifth month of the ecclesiastical year of the Jews. It corresponds to the period of July 15 to Aug 15. The word is of Babylonian origin; adopted by the Jews after the Babylonian exile

On the ninth is kept the Fast of Ab, or the Black Fast, to bewail the destruction of the first temple by Nebuchadrezzar (586 B.C.) and of the second by Titus (A.D. 70).

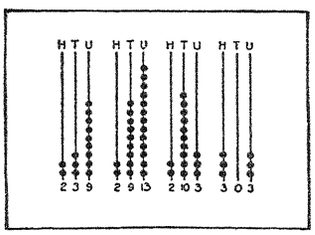
**ABA,** (1) a form of altazimuth instrument invented by, and called after, Antoine Thomson d'Abbadie; (2) a rough home-spun manufactured in Bulgaria; (3) a long coarse shirt worn by the Bedouin Arabs.

**ABĀBDA,** a nomad tribe of Arabs who reach northward to the Kena-Kuṣayr road, in the country east of Luxor Dirán, Aswán and the Northern Atbai. They call themselves "sons of the Jinns," and they are the Gebadei of Pliny and probably the Troglodytes of classical writers From time immemorial they have acted as guides to caravans through the Nubian desert and up the Nile valley as far as Sennar. Many of them are employed in the telegraph service across the Arabian desert. They are great trade carriers and visit far away districts. The Abābda of Egypt, numbering some 30,000, are governed by an hereditary "chief"; they generally speak Arabic mingled with Barabra words. As a tribe they claim descent from Selman, an Arab of the Beni Hilál They have adopted the dress and habits of the fellahin. In Nubia they live in villages, and their principal means of livelihood include agriculture, fishing, peddling, charcoal-burning, wood-gathering and trading in gums and drugs The Abābda build huts with hurdles and mats or live in natural caves. Their chief means of transportation is the camel and their chief foods are milk and durra. They are very superstitious, believing, for example, that evil would overtake a family if a girl member should, after her marriage, ever set eyes on her mother; hence the Abābda husband has to make his home far from his wife's village In the Mahdist troubles (1882–98) many "friendlies" were recruited from this tribe.

Keane, *Ethnology of Egyptian Sudan* (1884); *Anglo-Egyptian Sudan,* edited by Count Gleichen (19 von Russegger, *Die Reisen in Afrika* (1841–50); H. A. [illegible] *History of the Arabs in the Sudan* (1922).

**ABACÁ FIBRE,** the most valuable of all fibres for cordage, the product of *Musa textilis* (family Musaceae). This fibre is also known in the trade as manila and manila hemp, but abacá is a hard fibre and is entirely different from true hemp, which is a soft fibre and is the product of *Cannabis sativa.*

The abacá plant, which resembles in appearance the banana and plantain, to which it is closely related, is a perennial growing from short rootstocks. Numerous suckers grow from the rootstocks, forming a cluster of stalks 10 to 25 ft. in height. These stalks are formed by the broad, overlapping leaf stems and bear at the top a crown of large, undivided leaves. The point of growth is at the base, and the fibre is obtained from the outer portion of each successive leaf stem The flower stalk is pushed up through the centre of the plant, bearing at the top flowers that are followed by fruits similar to small bananas but filled with black seeds. Abacá plants grown from seeds do not come true to type, and this plant is propagated from suckers or from rootstocks.



The abacá plant flowers when about two years old, at which stage it is in the most favourable condition for the production of fibre. The stalk is then cut down, and the outer [illegible] layer of each successive leaf stem is stripped off in the form of ribbons, known as "tuxies." The tuxies are pulled under a knife that is pressed against a block of wood by means of a bamboo spring. This scraping process removes the pulp and other waste material, leaving the cleaned fibre in the hands of the operator The fibre so cleaned has only to be hung up to dry in the open air, when, without further treatment, it is ready to be graded and baled for shipment. A small machine that is an adaptation of the hand cleaning process is used rather extensively in the Philippines. In operating this machine, the tuxie is looped around a revolving wooden spindle, which draws it under the stripping knife. Large automatic machines, of the same type as the sisal-cleaning machines, are used for cleaning abacá fibre in the Netherlands Indies and in countries of Latin America

The quality or grade of abacá fibre is determined by the part of the stalk from which the fibre is obtained, by the amount of serration of the stripping knives and the degree of tension holding the knife against the block, and by prompt and careful drying of the fibre. The outer sheaths of the abacá stalk contain a rather short, strong but discoloured fibre; the middle sheaths produce a fibre of medium colour and good strength; the sheaths near the centre of the stalk have a very white, fine fibre of medium strength. In the process of cleaning abacá fibre, the use of coarsely serrated stripping knives and the lack of proper tension on the stripping knife result in the production of coarse, low-grade fibre. Delay and carelessness in drying affect both the colour and the strength of the fibre.

The exceptional strength of abacá fibre and its quality of resistance to the action of salt water make it particularly suitable for marine cordage It is also largely used for well-drilling cables, hoisting ropes and various other types of rope where strength and durability are required. Henequen and sisal have largely replaced abacá as a binder twine fibre. In the Philippines the superior grades of abacá are used for textile fabrics, hats, slippers rugs and various other articles. In Japan, large quantities of abacá fibre, and particularly the waste products, are used for the manufacture of paper From the old and disintegrated ropes is made the well-known manila paper

The abacá plant has been introduced into many different tropical regions, including the Netherlands Indies, India, the Andaman Islands, the West Indies and Central America; formerly the commercial production of this fibre was confined to the Philippine Islands. About 1921, shipments of abacá rootstocks were made from the Philippine Islands to Sumatra, where fairly large plantings were made Despite some expansion of the industry there, it remained relatively unimportant. Small abacá plantings were also made in North Borneo. In 1925 a shipment of propagating material of the superior varieties of abacá was brought from the Philippine Islands to the Republic of Panama by the United States department of agriculture. It was determined by experimental plantings that the climatic and soil conditions of this region are suitable for the abacá plant; that this plant is resistant to the more serious diseases of the banana plant and that abacá fibre of excellent quality can be produced in tropical America. In 1937 and 1939 these plantings were expanded to about 2,000 acres, and in 1942 there was a larger expansion both in Panama and in other countries of Central America (H T. Es.)

**ABACUS,** an early device for tracing numerals on a dust covered board. There have been three standard types: (1) a board covered with dust, whence the derivation, or, at a later period, with wax, and serving the same purpose as a slate in the 19th century or as the modern pad of paper; (2) a table marked with lines upon or between which were placed loose counters in the form of small discs of metal, bone, glass or other material, or (in China) in the form of rods; and (3) a table on which the counters were fastened by means of grooves.

FROM SMITH, "HISTORY OF MATHEMATICS"

FIG. 1.—A PROBABLE FORM OF EARLY COMPUTATION

The lines represent hundreds, tens and units. The computation represented is:
239 + 64 = 29[13] = 2[10]3 = 303

The early counter abacus was a table with lines to represent units, tens, hundreds, etc., or to represent different units of value, like pounds, shillings and pence Addition on such an abacus was doubtless performed as represented in fig. 1, which shows the successive steps in the addition of 64 and 239. Subtraction was simply the process of taking away counters; multiplication was considered as repeated addition, and division as repeated subtraction. This type of abacus was known in the Mediterranean countries, and Herodotus (c. 450 B.C.) is authority for the statement that the Egyptians wrote their figures

and reckoned with pebbles "bringing the hand from right to left," while the Greeks proceeded in the opposite direction. There are several references to the abacus in Roman literature, and what is apparently a Greek computing table was found in the 19th century on the island of Salamis.

Latin writers tell of three types of abacus in use in Rome,

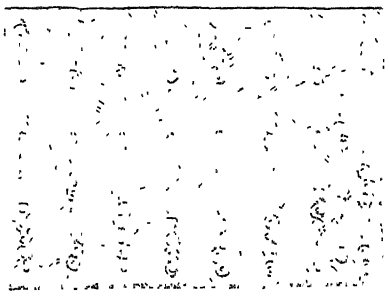


FIG 2

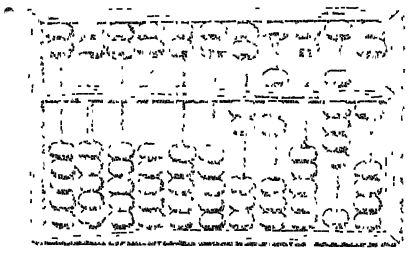

FIG. 5

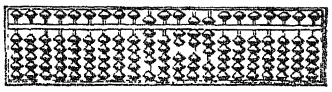

FIG. 6

FROM SMITH, "HISTORY OF MATHEMATICS"

VARIOUS TYPES OF EARLY COMPUTING DEVICES

Fig. 2.—A late Roman abacus, whose source is unknown. This bronze piece of uncertain date has grooves in which the counters slide. Each upper button represents five units and each lower button one unit of the order in which the column stands

Fig. 3.—Korean computing rods. Made of bone, these rods were used in the native Korean schools until the end of the 19th century

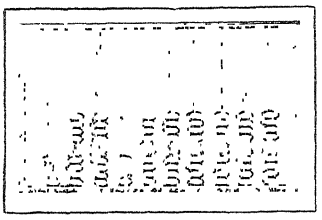

Fig. 4.—A Japanese ruled "Sangi" board. Upon this board the computing rods ("Sangi") were placed to represent algebraic coefficients

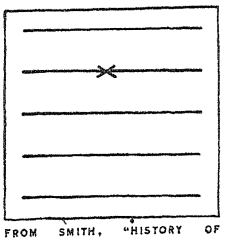
Fig. 5.—A modern Chinese abacus. The "suan-pan" was used as early as the 12th century. The number represented is 27091. Each upper bead has a value of five of its order and each lower bead the value of one of its order. Often employed in Chinese laundries

Fig. 6.—A Japanese abacus. The "soroban" was in use as early as the 16th century. The number represented in the central part is 90278

namely: (1) the sand board or the wax tablet, (2) a marked table for counters, and (3) a table with grooves in which the counters were free to slide. Fig. 2 shows a late Roman abacus now in the British museum, each upper button representing five units of the order in which the column stands, and each lower button representing one unit of the same order. Cicero (*Phil. Frag.*, V, 59) speaks of the counters as *aera* (bronzes), but the common name was *calculi* (pebbles) or *abaculi*, the pieces being made of stone, ivory (Juvenal, xi, 131), metal or coloured glass (Pliny. *Hist. Nat.*, xxxvi, 26, 67).

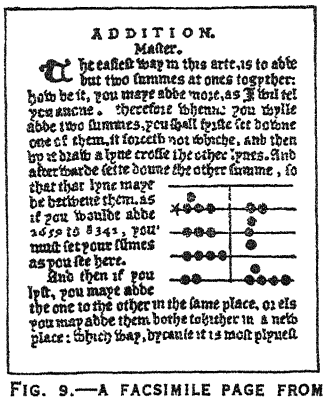


The earliest type of abacus in China seems to have been the "bamboo rods" that served instead of counters These were known as early as the 6th century B.C. and they survived in Korea until the close of the 19th century (fig. 3). They found their way into Japan about the year 600 and were known as *sangi* or *sanchu*. Until recent times they were used to represent algebraic coefficients, being placed on a board ruled as shown in fig 4

FROM SMITH, "HISTORY OF MATHEMATICS"

FIG. 7.—A RUSSIAN ABACUS

The "s'choty" of the Russians, "choreb" of the Armenians or "coulba" of the Turks. The wires are slightly arched, a feature which is not shown in the illustration



FROM SMITH, "HISTORY OF MATHEMATICS"

FIG. 8.—A MEDIAEVAL COMPUTING TABLE

This method of ruling the computing board was extensively used in the middle ages

Since the 12th century the *suan-pan* (computing tray; *see* fig. 5) has been generally used throughout China. The chief difference between this and the Roman abacus lies in the fact that it has one more bead in each section. In the 16th century this type, slightly changed and bearing the kindred name of *soroban* (fig 6), found its way into Japan, where it is still in use. An abacus differing considerably from the Roman or oriental types is found in the middle eastern countries. The Turks call it the *coulba;* the Armenians, the *choreb;* and the Russians, the *s'choty* (fig. 7). As in the case of the *suan-pan* and the *soroban*, this permits of rapid computation and serves a purpose similar to that of the modern calculating machines (*q.v.*).

There appeared in Europe in the middle ages the line abacus. This type of abacus consisted of a table ruled with horizontal lines representing the successive powers of ten, each space representing half the value of the line immediately above it (fig. 8). This type was in use until well into the 18th century. A pupil who could compute on such a table was said to "know the lines," and the verb "to abacus" was used as the equivalent of the verb "to compute." The method employed may be inferred from a passage in Robert Recorde's *Ground of Artes* (about 1542) as shown in fig. 9.

ADDITION.

Master.

The eaſieſt way in this arte, is to adde but two ſummes at ones together: how be it, you maye adde more, as I ſhall ſet you eaſine. Therefore whenne you wylle adde two ſummes, you ſhall fyrſte ſet bothe one of them, it forceth not whiche, and then by it draw a lyne croſſe the other lynes. And after warde ſette downe the other ſumme, ſo that that lyne maye be betweene them, as if you wouldſt adde 2659 to 8342, you muſt ſet your ſummes as you ſee here.

And then if you lyſt, you maye adde the one to the other in the ſame place, or els you may adde them bothe together in a newe place: which way, becauſe it is moſt playne

FIG. 9.—A FACSIMILE PAGE FROM ROBERT RECORDE, "GROUND OF ARTES"

This reduced page, from the edition of 1558, shows the first step in the addition of 2659 and 8342

The discs that were used in computing were commonly known in Great Britain as "counters" (countures, cowntouris); in the Latin books as *projectiles* (*pro*, forward, + *jacere*, to throw), being thrown or cast upon the counting board, or as *denarii supputarii* (computing pennies); and in France as *jetons* (with many such variants as *gects, jectoirs, gietons* and *jettons*, from *jacere*, to throw). In Germany a counter was called a *Rechenpfennig* or *Zahlpfennig* (number penny). Such later expressions as "cast an account," "borrow one," "carry two," and possibly "lay a wager" have their origin in this kind of computation. The Court of the Exchequer, the "counting house," the "counter" in the modern shop, billiard counters, poker "chips," and various games trace their origin to the counting board.

Gerbert (*c.* 1000), who became Pope Sylvester II, invented an "arc abacus" in which each counter bore a certain Indo-Arabic numeral excepting the zero, the periods in groups of three being united by an arc. It had little recognition, however, for as soon as the significance of the zero became apparent (*see* NUMERALS) it was manifestly of no value.

(*See* CALCULATING MACHINES; FINGER NUMERALS)

(D. E. S.)

Knott, "The Abacus in its Historic and Scientific Aspects," *Transactions of the Asiatic Society of Japan,* 14:18 (1886); F. C. Scesney, *The Chinese Abacus* (1944), D. E. Smith, *History of Mathematics,* 2.156-95 (1925); Y. Yoshimo, *The Japanese Abacus Explained* (Tokyo, 1937).

**ABACUS,** in architecture, the upper member of a column capital whose function is to provide a supporting surface for the structure above. In Egyptian capitals it is smaller than the parts below and in the late work it has great height. In the Greek Doric order it is a plain square slab, but in the Roman Doric it is usually crowned by a moulding. In the Greek Ionic order it is at first rectangular, to cap the projection of the volutes, but later becomes square, except at corner capitals where it is curved out over the angle volutes. In both Greek and Roman Corinthian orders and in the composite and four-sided or Scamozzi Ionic order it is moulded with concave sides and usually the corners are cut off slightly. In Romanesque architecture the abacus usually is square, with sides splayed or moulded, and in the Gothic, outside of England, it is square or octagonal and richly moulded. In English Gothic, however, circular forms are frequent, especially in 13th-century work. The diminutive, *abaciscus,* is applied to the squares of a tessellated pavement.

**ABADAN** (Iran), an island situated in the delta of the Shatt-al-Arab (*q.v.*), 40 mi. in length, from 2 to 12 mi. in breadth, bounded on the north and east by the Karun river (*q.v.*) and its tributary, the Bahmishir, on the west by the Shatt-al-Arab, and on the south by the Persian gulf. It is known to Arabs as Jazirat-ul-Khidhr from a tomb situated on the Bahmishir dedicated to the saint of that name. Abadan is referred to by the historian Nasir Khusrau, writing in the 13th century, as the most southerly settlement of Mesopotamia, and it is not improbable that it is identical with the site of the port Charax mentioned by Herodotus. The possession of this island was long in dispute between Persia and Turkey. It was definitely allotted to Persia by the treaty of Erzerum, 1847, the Turks however retaining control of the whole of the Shatt-al-Arab while ensuring to Persia freedom of navigation.

In 1909 the Anglo-Persian Oil Company, Ltd. (*q.v.*), under a lease agreement with the local overlord, the sheikh of Mohammerah, established its pipe-line terminus and refinery on the island between the hamlets of Braim and Bawardah, and this settlement, now known as Abadan (lat. 30° 21′ N., long. 48° 17′ E.), developed into a town of between 50,000 and 60,000 people, organized by the Iranian government as a municipality. Fifteen deep-water jetties have been built along the foreshore to facilitate the loading of tankers and the unloading of machinery, etc. Exports of oil during 1942 from Abadan totalled nearly 5,000,000 tons. During the same period imports of machinery, etc., unloaded at Abadan totalled about 85,000 tons, with a value of more than 164,000,000 rials. There is an excellent equipment of derricks and travelling cranes and several berths for good-sized vessels. The distance along the pipe line from Masjid Suleiman to Abadan is about 137 mi. Communication exists by a very good motor road from Abadan to Mohammerah, 9 mi.; from Abadan to Ahwaz up the pipe line, 78 mi., and thence to Masjid Suleiman, a further 68 mi. A motor road also exists from Basra (*q.v.*) to Sibah, opposite Abadan, on the right bank of the Shatt-al-Arab.

*See* J. W. Williamson, *In a Persian Oil Field,* 2nd. ed. (1930).

**ABADDON,** a Hebrew word meaning "destruction." In poetry it comes to mean "place of destruction," and so the underworld or Sheol (*cf.* Job xxvi, 6). In Rev. ix, 11 Abaddon is used of hell personified, the prince of the underworld. The term is here explained as Apollyon (*q.v.*), the "destroyer."

**ABADEH,** a small town of Iran, lying more than 6,000 ft. above sea level in a fertile tract on the road between Isfahan and Shiraz. It has telegraph and post offices, and is famed for its woodwork; small boxes, trays and spoons with elaborately carved lacelike handles are made of pear and boxwood.

**ABAE,** a town in Greece, in the northeastern corner of Phocis, famous in early times for its oracle of Apollo, one of those consulted by Croesus (Herod. i, 46). Its rich treasures (Herod viii, 33) were sacked by the Persians, and the temple remained ruinous. The oracle was, however, still consulted, *e.g.,* by the Thebans before Leuctra (Paus. iv, 32, 5). The temple, burned again during the Sacred War, was very dilapidated when seen by Pausanias (x, 35); some restoration and the building of a new temple was undertaken by Hadrian. Privileges due to the sanctity of the shrine (*Bull. Corresp. Hell. vi,* 171), were confirmed to the people of Abae by the Romans. The polygonal walls of the acropolis may still be seen, with one gateway and traces of town walls below. *See* V. W. Yorke, "Excavations at Abae," *Journal of Hellenic Studies,* 16: 291–312 (London, 1896).

**ABAILARD:** *see* ABÉLARD, PETER.

**ABAKANSK,** or Abakan, capital of Khakass autonomous region in the Krasnoyarsk province of the R.S.F.S.R. Pop. of region (1939) 270,655. Area 19,276 sq mi. It is situated in 54° 26′ N. and 91° 15′ E., north of the junction of the Abakan river with the Yenisei river; it is a river port with a wharf. It lies in the fertile and sheltered Minusinsk oasis and is linked by river to Krasnoyarsk on the Trans-Siberian railway; the railway from Achinsk to Minusinsk passes it on the west bank of the river. It is a centre for grain, potatoes, cattle, beekeeping products, etc., but is liable to occasional severe floods. Near it are *tumuli* of the Li-Kitai and statues 7 to 9 ft. high, covered with hieroglyphs. Abakansk had in 1939 a population of 13,500.

**ABALONE** (a Spanish word of unknown derivation), the name given in California to various species of molluscs of the widely distributed genus *Haliotis* ("ear shells," Ormers). The shell of these animals yields mother-of-pearl and is used in button-making and inlaying. The abalone was a favourite article of food among the Indians of California, and is still eaten there as well as in Japan and China. The Californian abalone is represented by various species; *Haliotis splendens, H. rufescens* and *H. cracherodii* are the most important ones. (*See* ORMER.)

BIBLIOGRAPHY.—*See* H. Pilsbry, *Manual of Conchology* (1890); J. Keep, *The Nautilus* (1880); Calif. Dept. of [illegible] *Fish Bul. No. 1* (1913); C. L. Edwards, "Abalones of California," *Smithsonian Inst. Ann. Rept.,* pp. 429–438 (1913). (G. C. R.; X.)

**ABANA** (or, as indicated to be read in the Hebrew text, *Amana,* classical *Chrysorrhoas*) and PHARPAR (Heb. *Parpar*) the "rivers of Damascus" (II Ki. v, 12). They are commonly identified with the two most important rivers of the district, the Barada, flowing through Damascus from its source in the Anti-Lebanon, and the 'Awaj, some 8 mi. S. of Damascus with its source in the Hermon range. The size of the rivers was probably of less moment than the sacredness of their waters. Abana (or Amana) may well be the Barada. A tributary, the Nahr Banias, perhaps retains an echo of the name. North of the 'Awaj is the independent Barbar in which we seem to have the name Pharpar. All the rivers of the district are either entirely dissipated in irrigation or eventually lose themselves in marshes to the east.

**ABANCOURT, CHARLES XAVIER JOSEPH DE FRANQUEVILLE D'** (1758–1792), French statesman, was Louis XVI's last minister of war (July 1792), and organized the defense of the Tuileries for Aug. 10. He was arrested for treason to the nation and sent to Orléans to be tried. At the end of August the assembly ordered Abancourt and the other prisoners at Orléans to be transferred to Paris. At Versailles the escort learned of the massacres at Paris, and Abancourt and his fellow-prisoners were murdered on Sept. 8, 1792.

**ABANDONMENT,** in law, the relinquishment of an interest, claim, privilege or possession. Its signification varies according to the branch of the law in which it is employed, but the more important uses of the word are summarized below.

ABANDONMENT OF AN ACTION is the discontinuance of proceedings commenced in the High Court of Justice either because

the plaintiff is convinced that he will not succeed in his action or for other reasons.

Previous to the Judicature act of 1875, considerable latitude was allowed as to the time when a suitor might abandon his action, and yet preserve his right to bring another action on the same suit; but since 1875 this right has been considerably curtailed, and a plaintiff who has delivered his reply, and afterward wishes to abandon his action, can generally obtain leave so to do only on condition of bringing no further proceedings in the matter. (*See* PRACTICE AND PROCEDURE.)

ABANDONMENT IN MARINE INSURANCE is the surrender of the ship or goods insured to the insurers, in the case of a constructive total loss of the thing insured. For the requisites and effects of abandonment in this sense *see* MARINE INSURANCE.

For the *abandonment* of a child of any age, *see* the article CHILDREN: PROTECTIVE LAWS.

ABANDONMENT OF DOMICILE is the ceasing to reside permanently in a former domicile coupled with the intention of choosing a new domicile. The presumptions which will guide the court in deciding whether a former domicile has been abandoned or not must be inferred from the facts of each individual case. (*See* DOMICILE.)

ABANDONMENT OF AN EASEMENT is the relinquishment of some accommodation or right in another's land, such as right of way, free access of light and air, etc. (*See* EASEMENT.)

**ABANO, PIETRO D'** (*c.* 1250–*c.* 1316), known also as PETRUS DE APONO or APONENSIS, Italian physician and philosopher, was born at Abano in 1250 or 1246. After studying medicine and philosophy at Paris he practised at Padua. He was twice brought to trial by the Inquisition on a charge of practising magic; on the first occasion he was acquitted, and he died before the second trial was completed. His best known works, in which he advocates the systems of Averroes and other Arabian writers, are the *Conciliator differentiarum quae inter philosophos et medicos versantur* and *De venenis eorumque remediis.*

**ABANO TERME,** a town in the province of Padua, Italy, on the eastern slope of Monti Euganei, 6m. S.W. by rail of Padua. Pop. (1936) 1,232 (town), 7,062 (commune). Its popular hot springs and mud baths were known to the Romans as *Aponi fons* or *Aquae Patavinae.* Ancient remains have been found. The Italian *Comando Supremo* was fixed here from Jan. 1918 to the signing of the Armistice, Nov. 3, in the local Villa Giusti.

**ABANTES,** the traditional name of the ancient inhabitants of Euboea, to whom was also ascribed the building of the town of Abae in Phocis.

**ABARBANEL:** *see* ABRABANEL, ISAAC.

**ABASGIA:** *see* GEORGIA.

**ABATED,** an obsolescent technical term applied in masonry and metal work to portions sunk beneath the general surface, as in panels where the background is sunk so as to leave letters or ornament in relief.

**ABATEMENT,** a beating down or diminishing, a term used especially in various legal phrases.

**Abatement of a nuisance** is the remedy of destroying or removing, allowed by law to a person or public authority injured by a public nuisance, provided no breach of the peace is committed in doing so. In the case of private nuisances abatement is also allowed provided there be no breach of the peace, and no damage be occasioned beyond what the removal of the nuisance requires (*see* NUISANCE).

**Abatement of freehold** takes place where, after the death of the person last seized, a stranger enters upon lands before the entry of the heir or devisee, and keeps the latter out of possession. It differs from intrusion, which is a similar entry by a stranger on the death of a tenant for life, to the prejudice of the reversioner, or remainder man; and from disseisin, which is the forcible or fraudulent expulsion of a person seized of the freehold (*see* FREEHOLD).

**Abatement of debts and legacies.**—When the assets of a deceased person are not sufficient to satisfy fully all the various creditors, their debts must abate proportionately, and they must accept a dividend. Also, in the case of legacies, when the funds or assets out of which they are payable are not sufficient to pay them in full, the legacies abate in proportion, unless there is a priority given specially to any particular legacy (*see* LEGACY). Annuities are subject to the same rule as general legacies

**Abatement in pleading,** or plea in abatement, was directed to defeating or quashing a particular action by some matter, such as a defect in form or the personal incompetency of the parties suing, pleaded by the defendant. All pleas in abatement are now abolished (Rules of the Supreme Court Order 21) In criminal proceedings the plea in abatement was nullified by the Criminal Law act, 1826, which required the court to amend according to the truth, and the Criminal Procedure act, 1851, which rendered description of the defendant unnecessary.

**Abatement in litigation.**—In civil proceedings no action abates by reason of the marriage, death or [illegible] of any of the parties, if the cause of action survives or continues, and does not become defective by the assignment, creation or devolution of any estate or title *pendente lite* (R.S.C. Order 17). Criminal proceedings do not abate on the death of the prosecutor, being in theory instituted by the Crown, but the Crown itself may bring about their termination without any decision on the merits and without the assent of the prosecutor.

**Abatement in heraldry** is a badge in coat-armour, indicating degradation or dishonour. It is called also *rebatement.*

**Abatement in taxation.**—A reduction in assessment to taxation or in rate of tax, which is made to remove anomalies, mitigate hardship or refine a scale of duties. Abatements have long been a special feature of the British income-tax system For many years a rough-and-ready graduated income-tax was formed by imposing a fixed poundage rate upon all incomes of whatever size, and providing in the Finance Act for (1) the total exemption of very small incomes and (2) the reduction or "abatement" of the assessments made upon incomes above the exemption limit and not exceeding certain moderate amounts. This abatement system has been swept away, but abatements of assessment to mitigate rate of tax are still made in respect of the maintenance of wife and young children and the payment of a life insurance premium. (*See* INCOME TAX.) In the United States abatement of State and local taxation is governed solely by statute, and the laws of the various States and the court decisions thereunder should therefore be consulted for specific information. Abatement of Federal taxation is also purely statutory; and the question is governed exclusively by numerous Acts of Congress, including Sec. 3220 of the Revised Statutes (as amended) and the various Federal revenue acts together with the regulations thereon. (*See* TAXATION.)

**ABATI** (ah-bah'tē), **NICCOLO** or DELL' ABBATO (1512–1571), a celebrated fresco-painter of Modena, whose best works are there and at Bologna. He accompanied Primaticcio to France, and assisted in decorating the palace at Fontainebleau (1552–71). A fine example of his work, representing the martyrdom of St. Peter and St. Paul, is in the Dresden Gallery.

**ABATIS,** ABATTIS or ABBATTIS (a French word meaning a heap of material thrown), a term in field fortification for an obstacle formed of the branches of trees laid in a row, with the tops directed towards the enemy and interlaced or tied with wire. The abatis is used alone or in combination with wire-entanglements and other obstacles.

**"A" BATTERY,** a battery which provides heating current for the filament of a vacuum tube (*see* ELECTRON TUBE).

**ABATTOIR:** *see* SLAUGHTERHOUSE.

**ABAUZIT** (ah-bō-zē), **FIRMIN** (1679–1767), French scholar, was born of Protestant parents at Uzès, in Languedoc, Nov. 11, 1679, and died at Geneva, March 20, 1767. After the revocation of the Edict of Nantes in 1685 his family took refuge in Geneva, where he received his education. Abauzit visited Holland and England, and was one of the earliest defenders of the discoveries of Sir Isaac Newton. He declined an offer from William III to settle in England, also the offer of the chair of philosophy at Geneva. A sinecure as librarian to the city of Geneva gave him leisure to pursue his multifarious studies. J. J. Rousseau praises him in *Nouvelle Héloïse,* and Voltaire, when a visitor said he had come to see a great man, asked if he

had seen Abauzit. A collection of his writings was published at Geneva in 1770, and another in London in 1773.

Information regarding Abauzit will be found in J Senebier's *Histoire littéraire de Genève,* Harwood's *Miscellanies* and W. Orme's *Bibliotheca Biblica* (1824).

**'ABBA 'ARIKA,** the name of the Babylonian *'amora* of the 3rd century, who established at Sura the systematic study of the Rabbinic traditions which, using the Mishnah as text, led to the compilation of the Talmud. He is commonly known as Rab.

**ABBADIDES,** a Mohammedan dynasty which arose in Spain on the downfall of the western caliphate. The founder of the house was Abu'l-Qāsim Mohammed, the cadi of Seville in 1023. When he died in 1042, he had created a state which, though weak in itself, was strong as compared with the little powers about it. He had made his family the recognized leaders of the Mohammedans of Arab and native Spanish descent against the Berber element, whose chief was the king of Granada. Abbad, surnamed al-Motaḍid, his son and successor, is one of the most remarkable figures in Spanish Mohammedan history. A poet and a lover of letters, he was also a poisoner, a drinker of wine, a sceptic and treacherous to the utmost degree. He killed with his own hand one of his sons who had rebelled against him. On one occasion he trapped a number of his enemies, the Berber chiefs of the Ronda, into visiting him in the Alcazar at Seville and got rid of them by smothering them in the hot room of a bath. It was his taste to preserve the skulls of the enemies he had killed—those of the poorer men to be used as flowerpots, while those of the princes were kept in special chests. His reign until his death on Feb. 28, 1069, was mainly spent in extending his power at the expense of his smaller neighbours and in conflicts with his chief rival, the king of Granada. After 1063 he was assailed by Ferdinand the Great of Castile and Leon, who marched to the gates of Seville and forced him to pay tribute. His son, Mohammed Abu'l-Qāsim—who reigned by the title of al-Motamid—was the third and last of the Abbadides. He went further in patronage of literature than his father, for he chose as his favourite and prime minister the poet Ibn Ammar. He carried on the feuds of his family with the Berbers and in his efforts to extend his dominions could be as faithless as his father. In 1080 he brought down upon himself the vengeance of Alphonso VI of Castile by a typical piece of flighty oriental barbarity. He had endeavoured to pay part of his tribute to the Christian king with false money. The fraud was detected by a Jew, who was one of the envoys of Alphonso. Al-Motamid, in a moment of folly and rage, crucified the Jew and imprisoned the Christian members of the mission. Alphonso retaliated by a destructive raid. When Alphonso took Toledo in 1085, al-Motamid called in Yusuf ibn Tashfin, the Almoravide (*see* SPAIN: *History* and ALMORAVIDES). During the six years which preceded his deposition in 1091, al-Motamid behaved with valour on the field, but with much meanness and political folly. It was probably during this period that he surrendered his beautiful daughter Zaida to the Christian king, who made her his concubine and is said by some authorities to have married her after she bore him a son, Sancho. In 1091 the Almoravides stormed Seville. Al-Motamid, who had fought bravely, was weak enough to order his sons to surrender the fortresses they still held, in order to save his own life. He died in prison in Africa in 1095.

*See* R. P. A. Dozy, *Histoire des Musulmans d'Espagne* (Leyden, 1861; 2nd ed., 1932); and *Historia Abbadidarum* (*Scriptorum Arabum loci de Abbadidis,* Leyden, 1846). (D. H.)

**ABBADIE, ANTOINE THOMSON D'** (1810–1897), and **ARNAUD MICHEL D'** (1815–1893), travellers, were born in Dublin, of a French father and an Irish mother. The parents moved to France in 1818. In 1835 the French academy sent Antoine on a scientific mission to Brazil, the results being published in 1873 under the title of *Observations Relatives à la physique du globe faites au Brésil et en Éthiopie.* The younger Abbadie spent some time in Algeria before the two brothers started for Abyssinia in 1837, landing at Massawa in Feb. 1838. After collecting much information on the geography, geology, archaeology and natural history of Abyssinia, the brothers returned to France in 1848. The younger brother, Arnaud, paid another visit to Abyssinia in 1853. Antoine became involved in various controversies relating both to his geographical results and his political activities in Abyssinia. Time and the investigations of subsequent explorers have shown that Abbadie was quite trustworthy as to his facts, though wrong in his contention that the Blue Nile was the main stream. The topographical results of his explorations were published in Paris in 1860–73 in *Géodésie de l'Éthiopie.* Of the *Géographie de l'Éthiopie* (1890) only one volume has been published. *Un Catalogue raisonné de manuscrits éthiopiens* (1859) contains a description of 234 Ethiopian manuscripts collected by Antoine. He published numerous papers dealing with the geography of Abyssinia, Ethiopian coins and ancient inscriptions. His *Reconnaissances magnétiques* (1890) is an account of the magnetic observations made by him in the course of several journeys to the Red sea and the Levant.

The general account of the travels of the two brothers was published by Arnaud in 1868 under the title of *Douze ans dans la Haute-Éthiopie.* Antoine died in 1897 and bequeathed an estate in the Pyrenees, yielding 40,000 francs a year, to the Academy of Sciences, on condition of its producing within 50 years a catalogue of 500,000 stars. His brother Arnaud died in 1893.

**'ABBAHU,** the name of a Palestinian rabbi who flourished *c.* 279–320. 'Abbahu encouraged the study of Greek by Jews. He is very often cited in the Talmud.

**ABBA MARI** (in full, Abba Mari ben Moses ben Joseph), French rabbi, was born at Lunel, near Montpellier, toward the end of the 13th century. He is also known as Yarhi from his birthplace (Heb. *Yerah; i.e.,* "moon," *lune*), and he further took the name Astruc, Don Astruc or En Astruc of Lunel. In Montpellier, where he lived from 1303 to 1306, he was much distressed by the prevalence of Aristotelian rationalism, which, through the medium of the works of Maimonides, threatened the authority of the Old Testament, obedience to the law, and the belief in miracles and revelation. He, therefore, in a series of letters (afterward collected under the title *Minhat Kenaot; i.e.,* "Jealousy Offering") called upon the famous rabbi Solomon ben Adret of Barcelona to come to the aid of orthodoxy. Ben Adret, with the approval of other prominent Spanish rabbis, sent a letter to the community at Montpellier proposing to forbid the study of philosophy to those who were less than 30 years of age, and, in spite of keen opposition from the liberal section, a decree in this sense was issued by Ben Adret in 1305. The result was a great schism among the Jews of Spain and southern France, and a new impulse was given to the study of philosophy by the unauthorized interference of the Spanish rabbis. On the expulsion of the Jews from France by Philip IV in 1306, Abba Mari settled at Perpignan, where he published the letters connected with the controversy.

**'ABBĀS I** (1571–1629), shah of Persia, called the Great, was the son of Shah Mohammed Khudābanda (d. 1595). In 1581 he was proclaimed ruler of Khurāsān, and became shah in 1587 on his father's abdication. Confronted with anarchy in Persia and foreign invasion, he made peace with Turkey, subdued the rebels and attacked the Uzbegs, who were ravaging Khurāsān. In 1598 he regained Meshed, and shortly afterward defeated and expelled the Uzbegs. Three years later he reopened the war with Turkey, and in a series of campaigns in the northwest regained Tabriz (1604) and most of the Caucasian territories surrendered by the earlier treaty, including Georgia and Shirvan. The war continued, with intervals, to the end of his reign; in 1623 his troops occupied Baghdad, but failed to hold Mosul or to seize Basra. In 1622, with the aid of the English East India company, he expelled the Portuguese from the island of Hormuz, and much of its trade was diverted to Gombroon, renamed Bandar 'Abbās after him.

The military successes of Shah 'Abbās were largely the result of his reorganization of the army. In place of the tribal levies he created a regular force, thus not only gaining in efficiency but also reducing his dependence on the great nobles and tribal chiefs. An Englishman Sir Robert Sherley greatly improved the Persian

artillery. 'Abbās' reign was distinguished not only by military successes and administrative efficiency but also by the magnificence of his court and the splendid buildings that he erected, notably at his capital, Isfahan. He fostered industry and commerce by constructing highways, bridges and caravanserais, by granting privileges to his Armenian subjects and by encouraging the English and Dutch East India companies to trade in Persia. In religious matters he was generally tolerant. His fame was, however, tarnished by deeds of tyranny and cruelty: he put his eldest son to death and blinded another.

*See* L. L. Bellan, *Chah Abbas I, sa vie, son histoire* (Paris, 1932); Sir Edward Denison Ross (ed.), *Sir Anthony Sherley and His Persian Adventure* (London, 1933). (L. Lo.)

**ABBAS I** (1813–1854), pasha of Egypt, was a son of Tusun Pasha and grandson of Mohammed Ali. As a young man he fought in Syria under Ibrahim Pasha (*q.v.*), his real or supposed uncle. The death of Ibrahim in Nov. 1848 made Abbas regent of Egypt, and in Aug. 1849, just before the death of Mohammed Ali, he succeeded to the pashalik. He was reactionary, cruel, morose and taciturn and spent nearly all his time shut up in his palace. He undid, as far as he could, the works of his grandfather, good and bad. Among other things, he abolished trade monopolies, closed factories and schools and reduced the army to 9,000 men. At the instance of the British government he allowed the construction of a railway from Alexandria to Cairo. On July 13, 1854, he was murdered in Benha palace by two of his slaves.

**ABBAS II,** otherwise known as ABBAS HILMI PASHA (1874–1944), the last khedive of Egypt, was born in Cairo on July 14, 1874, and became the seventh ruler of the line of Mohammed Ali when he left his studies in Vienna to succeed his father, Tewfik Pasha, on Jan. 8, 1892. British official opinion attributed his marked Anglophobia to the early influence of his European education; but the tutelage of the British agent (the first Lord Cromer) was naturally galling, and there was already an incipient nationalism in Egypt. Abbas never came to good terms with the British although, after a visit to England in 1900, he declared himself ready to co-operate with them. He concerned himself with several matters of public interest; *e.g.*, irrigation, education and agriculture. But the attempt on his life by an Egyptian student in July 1914 during a visit to Constantinople suggests that he disappointed the nationalists. He was still in Constantinople when Turkey entered World War I; and his return was forbidden by the British, who declared a protectorate over Egypt and deposed him (Dec. 19, 1914). He was deprived of his estates in Egypt (though in Oct. 1930 he was granted a pension of £E30,000 a year). Having attempted, rather ineffectively, to collaborate with the Central Powers during World War I, he spent the remainder of his life in exile, chiefly in Switzerland. He died at Geneva on Dec. 21, 1944.

**ABBASIDS,** the name generally given to the second of the two great dynasties of the Mohammedan empire (*see* CALIPHATE). The Abbasid caliphs based their claim on their descent from al-Abbas (566–652), son of 'Abd al-Muttalib, an uncle of Mohammed, and regarded themselves as the true heirs of the Prophet, as opposed to the descendants of his cousin Ali and the Omayyad caliphs of Damascus. In the first half of the 8th century they headed a propagandist movement which gained some success among the Arabs and Persians in Khurasan and broke into open rebellion in 747. The Khurasanian armies, marching westward, defeated the Omayyad caliph Marwan II on the Greater Zab in Jan. 750 and proclaimed Abu'l-Abbas, the great-grandson of al-Abbas, as caliph.

The new dynasty encouraged the development of commerce and the liberal arts. The reigns of Harun al-Rashīd (786–809) and al-Ma'mūn (813–33) at Baghdad were periods of extraordinary splendour. But the empire as a whole stagnated and then decayed: independent governors established themselves in Africa and Khurasan. The ruin of the dynasty came, however, from those Turkish slaves who were constituted as a royal bodyguard by al-Mu'tasim (833–42). After a century of fluctuating fortunes, the caliph Radi (934–41) and his successors were constrained to hand over most of the functions of government to the commanders of their armies. The dynasty lasted for another three centuries, but without exercising temporal power, until the Mongols under Hulagu captured Baghdad (Feb. 28, 1258). A branch of the family continued to maintain a feeble show of authority, confined to religious matters, in Egypt under the Mameluke sultans, but the dynasty finally disappeared when Mutawakkil III was taken to Constantinople as a prisoner by the Ottoman sultan Selim I (1517). (H. A. R. G.)

**'ABBAS MIRZA** (1783–1833), Persian prince, was a younger son of Feth Ali, shah of Persia, and was nominated to succeed him. But he predeceased his father and the succession fell to his son, Mohammed Mirza. 'Abbas Mirza conducted many campaigns against Russia between 1800 and 1813 when, by the treaty of Gulistan, Georgia and other provinces were ceded to Russia. In 1826–28 he and his son were again campaigning against Russia, again with no final success, for the khanates of Erivan and Nakhichevan were ceded to Russia. In the interval of the Russian wars he fought against the Turks, winning a complete victory near Erzerum in 1821. After the final peace with Russia 'Abbas Mirza set about the reorganization of the province of Khūrāsān and died at Meshed in Dec. 1833. Although 'Abbas was unsuccessful in the wars against Russia, he displayed great skill as a general, and learned something from the European soldiers who helped him to reorganize his army. He was cultured and intelligent and lived more simply than was the royal custom.

**ABBAS-TUMAN,** a spa in the Georgian S.S.R. (41° 44′ N., 42° 46′ E.). Its hot sulphur springs (93½°–118½° F.) and astronomical observatory (4,240 ft.) are noted. Population 1,243.

**ABBAYE,** the name given to a group of French writers, painters and musicians who, in 1906, formed a community at Créteil, where they set up a printing press and published their works. Their number included Roger Allard, René Arcos, Henri Barzun, Albert Doyen, Georges Duhamel, Jules Romains, Charles Vildrac, etc.

**ABBAZIA,** in the province of Fiume, Italy, 56 mi. S.E. of Trieste by rail. Pop. (1936), 5,605 (town), 8,642 (commune, which is called Volosca-Abbazia). It is on the Gulf of Quarnero at the foot of the Monte Maggiore (4,580 ft.), sheltered and surrounded by laurel woods. The average temperature is 50° F. (winter), and 77° F. (summer). The old abbey, San Giacomo al Palo, whence the town's name, is now a villa. Abbazia used to have 50,000 visitors each year. The whole seacoast to the north and south is rocky and picturesque.

**ABBE, CLEVELAND** (1838–1916), U.S. meteorologist and astronomer, was born in New York city on Dec. 3, 1838. His training as astronomer under B. A. Gould, Franz Brünnow and Friedrich Struve (Pulkova, 1865–66) and work at the U.S. naval observatory developed his interest in weather changes. As director of the Cincinnati, O., observatory, 1869–73, he demonstrated the practicability of weather forecasts based on daily telegraphic synoptic charts, and in 1870 joined the U.S. signal corps to organize and direct its weather forecasts. When this greatly expanded service was transferred to the department of agriculture in 1891, he went as senior professor of meteorology. Abbe was often and justly called the "father of the weather bureau." *The Monthly Weather Review,* which he edited, was due to his intiative, and he was influential in introducing the system of standard time.

Among his works are: *Report on Standard Time* (1879); *Mechanics of the Earth's Atmosphere* (1892–1910); *Preparatory Studies for Deductive Methods* (1890); *Relation between Climate and Crops* (1901); *Physical Basis of Long-range Forecasting* (1902).

**ABBE, ERNST** (1840–1905), German physicist, was born in Eisenach, Thuringia, Jan. 23, 1840. He was educated at Göttingen and Jena. In 1863 he became an instructor, and in 1870 was made a professor, in the University of Jena, at which in 1878 he was appointed director of the astronomical and meteorological observatories. In 1866 he became connected with the optical works of Carl Zeiss, was made a partner in 1875, and contributed in a very large degree through his experiments to the excellence of the instruments and lenses made by the firm. In 1884, with Zeiss

and Otto Schott, he established important works for the production of technical glass Upon the death of Zeiss in 1888 he became the sole owner of the Zeiss optical works, which he reorganized as a co-operative establishment; the officials, the workmen and the university [illegible] in its profits. He invented the Abbe refractometer [illegible] many improvements in microscopic and photographic lenses His *Gesammelte Abhandlungen* were published in 1903–06. He died in Jena, Jan 14, 1905.

*See* F Auersbach, *Ernst Abbe* (1918)

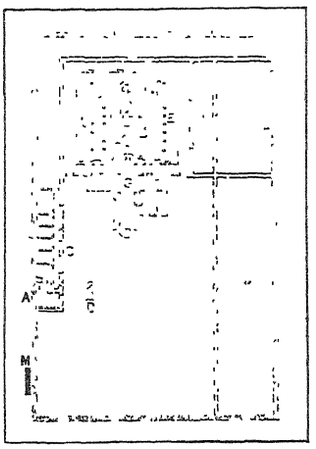
**ABBESS,** the superior of a community of nuns The mode of election, position, rights and authority of an abbess correspond generally with those of an abbot (*q v.*); but she cannot exercise priestly functions An abbess is elected by the secret votes of the sisters, installed solemnly by episcopal benediction, and has the abbatial cross, staff and ring; she holds office usually for life The Council of Trent fixed the qualifying age at 40, with 8 years of profession. In England abbesses attended ecclesiastical councils; *e.g.,* that of Becanfield in 694, where they signed before the presbyters. Abbesses presided over many of the early joint-houses of monks and nuns, *e g.,* at Whitby; and later the whole double order of Fontevraud (founded *c* 1100) was governed by an abbess In the German Evangelical Church the title of abbess (*Aebtissin*) has survived for the heads of abbeys which since the Reformation have continued as *Stifter; i e ,* collegiate foundations for the maintenance of unmarried women, generally of noble birth, called *Stiftsdamen*

**ABBEVILLE,** a city in the western part of South Carolina, U.S., 20 mi. from the Savannah river; the county seat of Abbeville county. It is served by the Seaboard railway. The population was 5,377 in 1950, 4,930 in 1940 and 4,414 in 1930 by the federal census. Cotton, tobacco and poultry are raised in the region, and clay is mined near the city. There are cotton mills in the city. Abbeville was settled about 1710 and incorporated in 1840.

**ABBEVILLE,** a town of northern France, the capital of an arrondissement, department of Somme, on the Somme, 12 mi from the English channel and 28 mi. N.W. of Amiens on the Northern railway. Pop. (1946) 16,780. It is built partly on an island and partly on both sides of the river, which is canalized from this point to the estuary. The tradition of settlement extends from the Palaeolithic through the late Bronze Age (when the area was very important).

Abbeville, chief town of Ponthieu, belonged in the 9th century to the abbey of St. Riquier, and afterward to the counts of Ponthieu It passed to the Alençon and other French families, and afterward to the house of Castille, from whom by marriage it went to Edward I of England. French and English ruled it by turns till 1435 when it was ceded to the duke of Burgundy. In 1477 it was annexed by Louis XI, and held by branches of the family until it was reunited to the crown in 1696. The streets are narrow and present an almost mediaeval appearance. The church of St. Vulfran, erected in the 15th, 16th and 17th centuries, was not entirely completed. The façade is a magnificent specimen of flamboyant Gothic flanked by two Gothic towers. Abbeville has other old churches and an hôtel de ville, with a belfry of the 13th century. Among the old houses, the Maison de François I dates from the 16th century. Situated on one of the main entries into France it became a great British base during World War I. Abbeville is an industrial centre; in addition to its old-established manufacture of cloth, hemp-spinning, sugar-making, shipbuilding and locksmiths' work are carried on; there is active commerce in grain, but the port has little trade. It has a tribunal of commerce and a board of trade-arbitrators.

**ABBEY, EDWIN AUSTIN** (1852–1911), U.S. painter, was born at Philadelphia April 1, 1852. He left the schools of the Pennsylvania Academy of Fine Arts at the age of 19 to enter the art department of the publishing house of Harper and Brothers in New York, where, in company with such men as Howard Pyle, Charles Stanley Reinhart, Joseph Pennell and Alfred Parsons, he became very successful as an illustrator. In 1878 he was sent by the Harpers to England to gather material for illustrations of the poems of Robert Herrick. These, published in 1882, attracted much attention, and were followed by illustrations for Goldsmith's *She Stoops to Conquer* (1887), for a volume of *Old Songs* (1889), and for the comedies (and a few of the tragedies) of Shakespeare. His water-colours and pastels were no less successful than the earlier illustrations in pen and ink. Abbey now became closely identified with the art life of England, and was elected to the Royal Institute of Painters in Water-Colours in 1883. Among his water-colours are "The Evil Eye" (1877); "The Rose in October" (1879); "An Old Song" (1886); "The Visitors" (1890), and "The Jongleur" (1892). Possibly his best-known pastels are "Beatrice," "Phyllis," and "Two Noble Kinsmen" In 1890 he made his first appearance with an oil painting, "A May Day Morn," at the Royal Academy in London. He exhibited "Richard duke of Gloucester and the Lady Anne" at the Royal Academy in 1896, and in that year was elected A R.A., becoming a full R.A. in 1898. Apart from his other paintings, special mention must be made of the large frescoes entitled "The Quest of the Holy Grail," in the Boston Public Library, on which he was occupied for some years; and in 1901 he was commissioned by King Edward VII to paint a picture of the coronation, containing many portraits elaborately grouped. The dramatic subjects, and the brilliant colouring of his oil pictures, gave them pronounced individuality among the works of contemporary painters. Abbey became a member not only of the Royal Academy, but also of the National Academy of Design of New York, and honorary member of the Royal Bavarian Society, the Société Nationale des Beaux Arts (Paris), the American Water-Colour Society, etc. He received first-class gold medals at the International Art Exhibition of Vienna in 1898, at Philadelphia in 1898, at the Paris Exhibitions of 1889 and 1900, and at Berlin in 1903; and was made a chevalier of the French Legion of Honour.



The last years of his life were devoted to mural paintings for the capitol at Harrisburg, Pa. Of these he undertook three, one for the House of Representatives, another for the Senate Chamber and the third for the ceiling of the dome. In 1910 there was completed under his supervision the decoration of the Peers' corridor of the Houses of Parliament at Westminster. He is represented by work at the Metropolitan Museum of Art in New York, the Boston Museum of Fine Arts and the National Gallery, London. He died in London on Aug. 1, 1911.

**ABBEY,** a monastery, or conventual establishment, under the government of an abbot or an abbess (Lat. *abbatia;* from Syr. *abba,* father).

The earliest Christian monastic communities (*see* MONASTICISM) with which we are acquainted consisted of groups of cells or huts collected about a common centre, which was usually the abode of some anchorite celebrated for superior holiness or singular asceticism. The formation of such communities in the East precedes Christianity, the example having been already set by the Essenes in Judea and the Therapeutae in Egypt.

In the earliest age of Christian monasticism the ascetics were accustomed to live singly, independent of one another, at no great distance from some village, supporting themselves by the labour of their own hands, and distributing to the poor the surplus after the supply of their own scanty wants. Increasing religious fervour, aided by persecution, drove them farther and farther away from the abodes of men into mountain solitudes or lonely deserts. The deserts of Egypt swarmed with the "cells" or huts of these anchorites. Anthony, who had retired to the Egyptian Thebaid during the persecution of Maximin, A.D. 312, was the most celebrated among them for his austerities, his sanctity, and his power as an exorcist. His fame collected round him a host of followers, emulous of his sanctity. The deeper he withdrew into the wilderness the more numerous his disciples became. They refused to be separated from him, and built their cells round that of their spiritual father. Thus arose the first monastic community, consisting of anchorites living each in his own little dwelling, united together under one superior. By degrees order was introduced in the groups of huts. They were arranged in lines like the tents in an encampment, or the houses in a street. From this arrangement these lines of single cells came to be known as

*Laurae*, Λαῦραι, "streets" or "lanes." The real founder of coenobian (κοινός, common, and βίος, life) monasteries in the modern sense was Pachomius, an Egyptian of the beginning of the 4th century. The first community established by him was at Tabennae, an island of the Nile in Upper Egypt Eight others were founded in his lifetime, numbering 3,000 monks Within 50 years from his death his societies could reckon 50,000 members. These coenobia resembled villages peopled by a hard-working religious community, all of one sex. The buildings were detached, small, and of the humblest character. The coenobia of Syria belonged to the Pachomian institution We learn many details concerning those in the vicinity of Antioch from Chrysostom's writings. The monks lived in separate huts, καλύβια, forming a religious hamlet on the mountain side. They were subject to an abbot, and observed a common rule. (They had no refectory, but ate their common meal, of bread and water only, when the day's labour was over, reclining on strewn grass, sometimes out of doors) Four times in the day they joined in prayers and psalms.

AFTER LENOIR

FIG. 1.—MONASTERY OF SANTA LAURA, MOUNT ATHOS. THE OLDER ABBEYS, CONSTRUCTED TO OFFER DEFENCE AGAINST ATTACKS, WERE BUILT WITH STRONG OUTER WALLS AND FEW ENTRANCES. SANTA LAURA HAD BUT TWO, THE MAIN ENTRANCE A AND THE POSTERN L

L. Postern gate
M. Tower

The necessity for defence from hostile attacks, economy of space, and convenience of access from one part of the community to another, by degrees dictated a more compact and orderly arrangement of the buildings of a monastic coenobium. Large piles of building were erected, with strong outside walls, capable of resisting the assaults of an enemy, within which all the necessary edifices were ranged round one or more open courts, usually surrounded with cloisters. The usual Eastern arrangement is exemplified in the plan of the convent of Santa Laura, Mount Athos (*Laura*, the designation of a monastery generally, being converted into a female saint).

This monastery, like the oriental monasteries generally, is surrounded by a strong and lofty blank stone wall, enclosing an area of between 3 and 4 acres. The longer side extends to a length of about 500ft. There is only one main entrance, on the north side (A), defended by three separate iron doors. Near the entrance is a large tower (M), a constant feature in the monasteries of the Levant. There is a small postern gate at L. The *enceinte* comprises two large open courts, surrounded with buildings connected with cloister galleries of wood or stone. The outer court, which is much the larger, contains the granaries and storehouses (K), and the kitchen (H) and other offices connected with the refectory (G). Immediately adjacent to the gateway is a two-storied guest-house, opening from a cloister (C). The inner court is surrounded by a cloister (EE), from which open the monks' cells (II). In the centre of this court stands the catholicon or conventual church, a square building with an apse of the cruciform domical Byzantine type. In front of the church stands a marble fountain (F), covered by a dome supported on columns. Opening from the western side of the cloister, but actually standing in the outer court, is the refectory (G), a large cruciform building, about 100ft. each way, decorated within with frescoes of saints. At the upper end is a semi-circular recess, in which is placed the seat of the *hegumenos* or abbot. This apartment is chiefly used as a hall of meeting, the oriental monks usually taking their meals in their separate cells.

**Benedictine.**—Monasticism in the West owes its extension and development to Benedict of Nursia (born A.D. 480). His rule was diffused with miraculous rapidity from the parent foundation on Monte Cassino through the whole of western Europe, and every country witnessed the erection of monasteries far exceeding anything that had yet been seen in spaciousness and splendour Few great towns in Italy were without their Benedictine convent, and they quickly rose in all the great centres of population in England, France, and Spain. The number of these monasteries founded between A.D. 520 and 700 is amazing. Before the Council of Constance, A.D 1415, no fewer than 15,070 abbeys had been established of this order alone. The buildings of a Benedictine abbey were uniformly arranged after one plan, modified where necessary (as at Durham and Worcester, where the monasteries stand close to the steep bank of a river) to accommodate the arrangement to local circumstances (*see* BENEDICTINES). We have no existing examples of the earlier monasteries of the Benedictine order. But we have fortunately preserved to us an elaborate plan of the great Swiss monastery of St. Gall, erected about A.D. 820, which puts us in possession of the whole arrangements of a monastery of the first class towards the early part of the 9th century. This curious and interesting plan has been made the

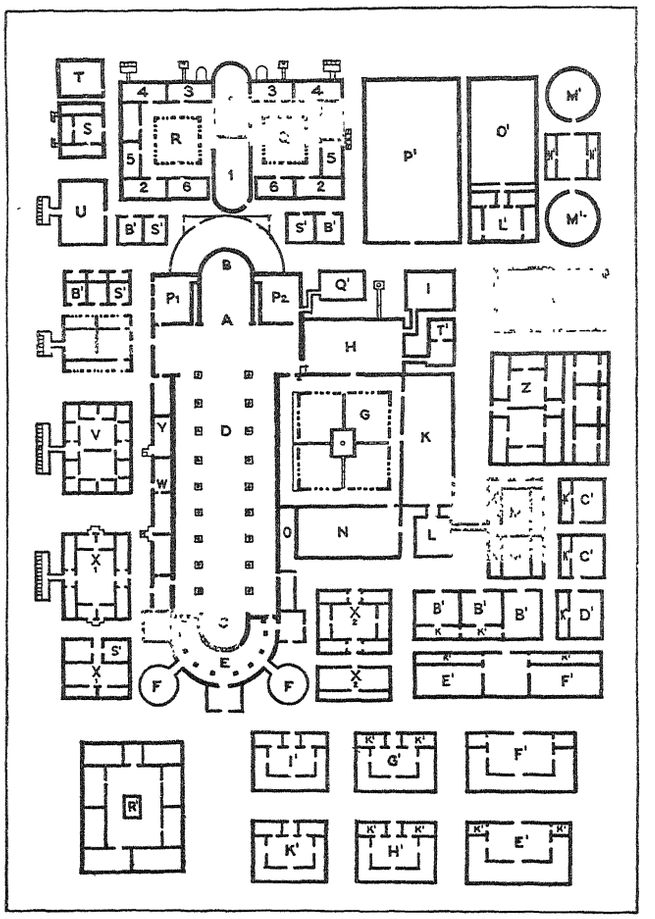

FIG. 2.—GROUND PLAN OF THE ABBEY OF ST. GALL, BUILT A.D. 820. THIS ABBEY FOLLOWED THE BENEDICTINE RULE OF BEING SELF-CONTAINED, AND HAD ITS OWN MILL AND BAKEHOUSE, TOGETHER WITH ACCOMMODATION FOR CARRYING ON ALL NECESSARY MECHANICAL ARTS

subject of a memoir both by Keller (Zürich, 1844) and by Professor Robert Willis (*Arch. Journal*, 1848, vol. v, pp. 86–117). To the latter we are indebted for the substance of the following description, as well as for the plan, reduced from his elucidated transcript of the original preserved in the archives of the convent The general appearance of the convent is that of a town of isolated houses with streets running between them. It is evidently planned in compliance with the Benedictine rule, which enjoined that, if possible, the monastery should contain within itself every necessary of life, as well as the buildings more intimately connected with the religious and social life of its inmates. It should comprise a mill, a bakehouse, stables, and cow-houses, together with accommodation for carrying on all necessary mechanical arts within the walls, so as to obviate the necessity of the monks going outside its limits.

The general distribution of the buildings may be thus described. The church, with its cloister to the south, occupies the centre of a quadrangular area, about 430ft. square. The buildings, as in all great monasteries, are distributed into groups. The church forms the nucleus, as the centre of the religious life of the community. In closest connection with the church is the group of buildings appropriated to the monastic life and its daily requirements—the refectory for eating, the dormitory for sleeping, the common room for social intercourse, the chapter-house for religious and disciplinary conference. These essential elements of monastic life are ranged about a cloister court, surrounded by a covered arcade, affording communication sheltered from the elements between the various buildings. The infirmary for sick monks, with the physician's house and physic garden, lies to the east. In the same group with the infirmary is the school for the novices. The outer school, with its headmaster's house against the opposite wall of the church, stands outside the convent enclosure, in close proximity to the abbot's house, that he might have a constant eye over them. The buildings devoted to hospitality are divided into three groups—one for the reception of distinguished guests, another for monks visiting the monastery, a third for poor travellers and pilgrims. The first and third are placed to the right and left of the common entrance of the monastery—the hospitium for distinguished guests being placed on the north side of the church, not far from the abbot's house; that for the poor on the south side next to the farm buildings. The monks are lodged in a guest-house built against the north wall of the church. The group of buildings connected with the material wants of the establishment is placed to the south and west of the church, and is distinctly separated from the monastic buildings. The kitchen, buttery, and offices are reached by a passage from the west end of the refectory and connected with the bakehouse and brewhouse, which are placed still farther away. The whole of the southern and western sides is devoted to workshops, stables and farm-buildings. The buildings, with some exceptions, seem to have been of one storey only, and all but the church were probably erected of wood.

**Canterbury Cathedral.**—A curious bird's-eye view of Canterbury cathedral and its annexed conventual buildings, taken about 1165, is preserved in the Great Psalter in the library of Trinity college, Cambridge. As elucidated by Prof. Willis,[1] it exhibits the plan of a great Benedictine monastery in the 12th century, and enables us to compare it with that of the 9th as seen at St. Gall. We see in both the same general principles of arrangement, which indeed belong to all Benedictine monasteries, enabling us to determine with precision the disposition of the various buildings, when little more than fragments of the walls exist. From some local reasons, however, the cloister and monastic buildings are placed on the north, instead, as is far more commonly the case, on the south of the church. There is also a separate chapter-house, which is wanting at St. Gall.

The buildings at Canterbury, as at St. Gall, form separate groups. The church forms the nucleus. In immediate contact with this, on the north side, lie the cloister and the group of buildings devoted to the monastic life. Outside of these, to the west and east, are the "halls and chambers devoted to the exercise of hospitality, with which every monastery was provided, for the purpose of receiving as guests persons who visited it, whether clergy or laity, travellers, pilgrims, or paupers." To the north a large open court divides the monastic from the menial buildings, intentionally placed as remote as possible from the conventual buildings proper, the stables, granaries, barn, bakehouse, brewhouse, laundries, etc., inhabited by the lay servants of the establishment. At the greatest possible distance from the church, beyond the precinct of the convent, is the eleemosynary department. The *almonry* for the relief of the poor, with a great hall annexed, forms the paupers' hospitium.

**Westminster Abbey.**—Westminster abbey is another example of a great Benedictine abbey, identical in its general arrangements, so far as they can be traced, with those described above. The cloister and monastic buildings lay to the south side of the church. Parallel to the nave, on the south side of the cloister, was the refectory, with its lavatory at the door, and on the eastern side the remains of the dormitory, raised on a vaulted substructure and communicating with the south transept. The chapter-house opened out of the same alley of the cloister. The small cloister lay to the south-east of the larger cloister, and still farther to the east the remains of the infirmary with the *table hall*, the refectory of those who were able to leave their chambers. The abbot's house formed a small courtyard at the west entrance, close to the inner gateway. Considerable portions of this remain, including the abbot's parlour, celebrated as "the Jerusalem Chamber," his hall, now used for the Westminster king's scholars, and the kitchen and butteries beyond.

**Cluny.**—The history of monasticism is one of alternate periods of decay and revival. With growth in popular esteem came increase in material wealth, leading to luxury and worldliness. The first religious ardour cooled, the strictness of the rule was relaxed, until by the 10th century the decay of discipline was so complete in France that the monks are said to have been frequently unacquainted with the rule of St. Benedict, and even ignorant that they were bound by any rule at all. The reformation of abuses generally took the form of the establishment of new monastic orders, with new and more stringent rules, requiring a modification of the architectural arrangements. One of the earliest of these reformed orders was the *Cluniac*, taking its name from the little village of Cluny, 12m. N.W. of Mâcon, near which, about A.D. 909, a reformed Benedictine abbey was founded by William, duke of Aquitaine and count of Auvergne, under Berno, abbot of Beaume. He was succeeded by Odo, who is often regarded as the founder of the order. The fame of Cluny spread far and wide. Its rigid rule was adopted by a vast number of the old Benedictine abbeys, who placed themselves in affiliation to the mother society, while new foundations sprang up in large numbers, all owing allegiance to the "archabbot," established at Cluny. By the end of the 12th century the number of monasteries affiliated to Cluny in the various countries of western Europe amounted to 2,000. The monastic establishment of Cluny was one of the most extensive and magnificent in France. We may form some idea of its enormous dimensions from the fact recorded, that, when, A.D. 1245, Pope Innocent IV. accompanied

[1] *The Architectural History of the Conventual Buildings of the Monastery of Christ Church in Canterbury.* By the Rev. Robert Willis. Printed for the Kent Archaeological Society, 1869.

by twelve cardinals, a patriarch, three archbishops, the two generals of the Carthusians and Cistercians, the king (St. Louis), and three of his sons, the queen mother, Baldwin, count of Flanders and emperor of Constantinople, the duke of Burgundy, and six lords, visited the abbey, the whole party, with their attendants, were lodged within the monastery without disarranging the monks, 400 in number. Nearly the whole of the abbey buildings, including the magnificent church, were swept away at the close of the 18th century. When the annexed ground-plan was taken, shortly before its destruction, nearly all the monastery, with the exception of the church, had been rebuilt.

The church, the ground-plan of which bears a remarkable resemblance to that of Lincoln cathedral, was of vast dimensions. It was 656ft by 130ft. wide. The nave was 102ft and the aisles 60ft high. The nave (G) had double vaulted aisles on either side Like Lincoln, it had an eastern as well as a western transept, each furnished with apsidal chapels to the east. The western transept was 213ft. long, and the eastern 123ft. The choir terminated in a semicircular apse (F), surrounded by five chapels, also semicircular. The western entrance was approached by an ante-church, or *narthex* (B), itself an aisled church of no mean dimensions, flanked by two towers, rising from a flight of steps bearing a stone cross The first English house of the Cluniac order was that of Lewes, founded by the earl of Warren, *c.* AD 1077. Of this only a few fragments of the domestic buildings exist The best preserved Cluniac houses in England are Castle Acre, Norfolk, and Wenlock, Shropshire.

The Cluniac revival, with all its brilliancy, was but short-lived. The celebrity of this, as of other orders, worked its moral ruin. With their growth in wealth and dignity the Cluniac foundations became as worldly in life and as relaxed in discipline as their predecessors, and a fresh reform was needed.

**Cistercian.**—The next great monastic revival, the Cistercian, arising in the last years of the 11th century, had a wider diffusion, and a longer and more honourable existence. The rapid growth and wide celebrity of the order are undoubtedly to be attributed to the enthusiastic piety of St. Bernard, abbot of the first of the monastic colonies, subsequently sent forth in such quick succession by the first Cistercian houses, the far-famed abbey of Clairvaux, AD. 1116. The rigid self-abnegation, which was the ruling principle of this reformed congregation of the Benedictine order, extended itself to the churches and other buildings erected by them. The characteristic of the Cistercian abbeys was the extremest simplicity and a studied plainness. Only one tower—a central one—was permitted, and that was to be very low. Unnecessary pinnacles and turrets were prohibited. The windows were to be plain and undivided, and it was forbidden to decorate them with stained glass. All needless ornament was proscribed. The crosses must be of wood; the candlesticks of iron. The renunciation of the world was to be evidenced in all that met the eye. The same spirit manifested itself in the choice of the sites of their monasteries. The more dismal, the more hopeless a spot appeared, the more did it please their rigid mood But they came not merely as ascetics, but as improvers The Cistercian monasteries are, as a rule, found placed in deep well-watered valleys. They always stand on the border of a stream; not rarely, as at Fountains, the buildings extend over it. These valleys, now so rich and productive, wore a very different aspect when the brethren first chose them as the place of their retirement. Wide swamps, deep morasses, tangled thickets, wild impassable forests, were their prevailing features. The "bright valley," *Clara Vallis* of St. Bernard, was known as the "valley of Wormwood," infamous as a den of robbers.

All Cistercian monasteries, unless the circumstances of the locality forbade it, were arranged according to one plan. The general arrangement and distribution of the various buildings which went to make up one of these vast establishments may be gathered from that of St. Bernard's own abbey of Clairvaux, which is here given. It will be observed that the abbey precincts are surrounded by a strong wall, furnished at intervals with watch-towers and other defensive works. The wall is nearly encircled by a stream of water, artificially diverted from the small rivulets which flow through the precincts, furnishing the establishment with an abundant supply in every part, for the irrigation of the gardens and orchards, the sanitary requirements of the brotherhood and for the use of the offices and workshops.

The precincts are divided across the centre by a wall, running from north to south, into an outer and inner ward—the former containing the menial, the latter the monastic buildings. The pre-

the east the smaller cloister, opening out of which were the infirmary, novices' lodgings, and quarters for the aged monks. Still farther to the east, divided from the monastic buildings by a wall, were the vegetable gardens and orchards, and tank for fish. The large fish-ponds, an indispensable adjunct to any ecclesiastical foundation, on the formation of which the monks lavished extreme care and pains, and which often remain as almost the only visible traces of these vast establishments, were placed outside the abbey walls.

Figure 5 furnishes the ground-plan of the distinctly monastic buildings on a larger scale. The usually unvarying arrangement of the Cistercian houses allows us to accept this as a type of the monasteries of this order. The church (A) is the chief feature. It consists of a vast nave of eleven bays, entered by a narthex, with a transept and short apsidal choir. (It may be remarked that the eastern limb in all unaltered Cistercian churches is remarkably short, and usually square.) To the east of each limb of the transept are two square chapels, divided according to Cistercian rule by solid walls. Nine radiating chapels, similarly divided, surround the apse. The stalls of the monks, forming the ritual choir, occupy the four eastern bays of the nave. There was a second range of stalls in the extreme western bays of the nave for the *fratres conversi*, or lay brothers. To the south of the church, so as to secure as much sun as possible, the cloister was invariably placed, except when local reasons forbade it. Round the cloister (B) were ranged the buildings connected with the monks' daily life. The chapter-house (C) always opened out of the east walk of the cloister in a line with the south transept. In Cistercian houses this was quadrangular, and was divided by pillars and arches into two or three aisles. Between it and the transept we find the sacristy (X), and a small book-room (Y), *armariolum*, where the brothers deposited the volumes borrowed from the library. On the other side of the chapter-house, to the south, is a passage (D) communicating with the courts and buildings beyond. This was sometimes known as the *parlour, colloquii locus*, the monks having the privilege of conversation here. Here also, when discipline became relaxed, traders, who had the liberty of admission, were allowed to display their goods. Beyond this we often find the *calefactorium* or *day-room* —an apartment warmed by flues beneath the pavement, where the brethren, half frozen during the night offices, betook themselves after the conclusion of lauds, to gain a little warmth, grease their sandals and get themselves ready for the work of the day. In the plan before us this apartment (E) opens from the south cloister walk, adjoining the refectory. The place usually assigned to it is occupied by the vaulted substructure of the *dormitory* (Z). The *dormitory*, as a rule, was placed on the east side of the cloister, running over the *calefactory* and *chapter-house*, and joined the south transept, where a flight of steps admitted the brethren into the church for nocturnal services. Opening out of the dormitory was always the *necessarium*, planned with the greatest regard to health and cleanliness, a water-course invariably running from end to end. The refectory opens out of the south cloister at (G). The position of the refectory is usually a marked point of difference between Benedictine and Cistercian abbeys. In the former, as at Canterbury, the refectory ran east and west parallel to the nave of the church, on the side of the cloister farthest removed from it. In the Cistercian monasteries, to keep the noise and smell of dinner still farther away from the sacred building, the refectory was built north and south, at right angles to the axis of the church. It was often divided, sometimes into two, sometimes, as here, into three aisles. Outside the refectory door, in the cloister, was the *lavatory*, where the monks washed their hands at dinner-time. The buildings belonging to the material life of the monks lay near the refectory, as far as possible from the church, to the south-west. With a distinct entrance from the outer court was the kitchen court (F), with its buttery, scullery, and larder, and the important adjunct of a stream of running water. Farther to the west, projecting beyond the line of the west front of the church, were vast vaulted apartments (SS), serving as cellars and storehouses, above which was the dormitory of the *conversi*. Detached from these, and separated entirely from the monastic buildings, were various workshops, which convenience required to be banished to the outer precincts, a saw-mill and oil-mill (UU) turned by water, and a currier's shop (V), where the sandals and leathern girdles of the monks were made and repaired.

Returning to the cloister, a vaulted passage admitted to the small cloister (I), opening from the north side of which were eight small cells, assigned to the scribes employed in copying works for the library, which was placed in the upper story, accessible by a turret staircase. To the south of the small cloister a long hall will be noticed. This was a *lecture-hall*, or

rather a hall for the religious disputations customary among the Cistercians. From this cloister opened the *infirmary* (K), with its hall, chapel, cells, blood-letting house, and other dependencies. At the eastern verge of the vast group of buildings we find the *novices' lodgings* (L), with a third cloister near the novices' quarters and the original guest-house (M) Detached from the great mass of the monastic edifices was the original abbot's house (N), with its dining-hall (P). Closely adjoining this, so that the eye of the father of the whole establishment should be constantly over those who stood the most in need of his watchful care—those who were training for the monastic life, and those who had worn themselves out in its duties—was a fourth cloister (O), with annexed buildings, devoted to the aged and infirm members of the establishment. The cemetery, the last resting-place of the brethren, lay to the north side of the nave of the church (H).

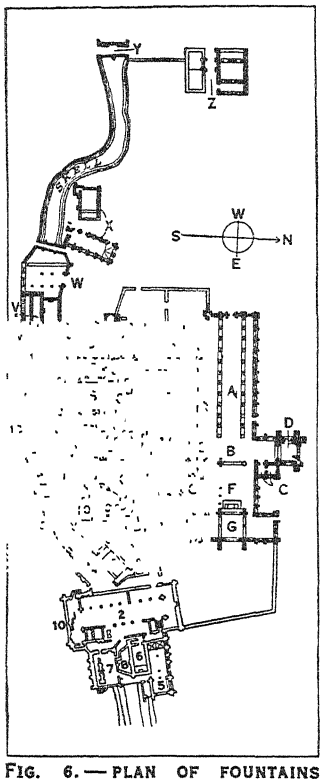

FIG. 6.—PLAN OF FOUNTAINS ABBEY, YORKSHIRE, FOUNDED A.D. 1132. ADDITIONS SHOWING A WIDE DEPARTURE FROM THE SIMPLICITY OF THE ORIGINAL FOUNDATIONS WERE MADE TO THE ABBEY IN SUCCEEDING CENTURIES UNTIL IT BECAME ONE OF THE MOST SPACIOUS IN ENGLAND

MONASTIC BUILDINGS: A. Nave of church. B. Transept. C. Chapels. D. Tower. E. Sacristy. F. Choir. G. Chapel of Nine Altars. H. Cloister. I. Chapter-house. K. Base court. L. Calefactory. M. ABBOT'S HOUSE: 1. Passage. 2. Great hall. 3. Refectory. 4. Buttery. 5. Storehouse. 6. Chapel. 7. Kitchen. 8. Ashpit. 9. Yard. 10. Kitchen tank

It will be seen from the above account that the arrangement of a Cistercian monastery was in accordance with a clearly defined system, and admirably adapted to its purpose. The base court nearest to the outer wall contained the buildings belonging to the functions of the body as agriculturists and employers of labour. Advancing into the inner court, the buildings devoted to hospitality are found close to the entrance; while those connected with the supply of the material wants of the brethren—the kitchen, cellars, etc.—form a court of themselves outside the cloister and quite detached from the church. The church, refectory, dormitory and other buildings belonging to the professional life of the brethren, surround the great cloister. The small cloister beyond, with its scribes' cells, library, hall for disputations, etc., is the centre of the literary life of the community. The requirements of sickness and old age are carefully provided for in the infirmary cloister and that for the aged and infirm members of the establishment. The same group contains the quarters of the novices.

The English Cistercian houses, of which there are such extensive and beautiful remains at Fountains, Rievaulx, Kirkstall, Tintern, Netley, etc., were mainly arranged after the same plan, with slight local variations.

**Fountains Abbey.**—Fountains abbey, first founded A.D. 1132, is one of the largest and best preserved Cistercian houses in England. Earlier buildings received considerable additions and alterations in the later period of the order, causing deviations from the strict Cistercian type The church stands a short distance to the north of the River Skell, the buildings of the abbey stretching down to and even across the stream. We have the cloister (H) to the south, with the three-aisled chapter-house (I) and calefactory (L) opening from its eastern walk, and the refectory (S), with the kitchen (Q) and buttery (T) attached, at right angles to its southern walk. Parallel with the western walk is an immense vaulted substructure (U), incorrectly styled the cloisters, serving as cellars and store-rooms, and supporting the dormitory of the *conversi* above. This building extended across the river. At its south-west corner were the necessaries (V), also built, as usual, above the swiftly flowing stream. The monks' dormitory was in its usual position above the chapter-house, to the south of the transept. As peculiarities of arrangement may be noticed the position of the kitchen (Q), between the refectory and calefactory, and of the infirmary (W) (unless there is some error in its designation) above the river to the west, adjoining the guest-houses (XX). We may also call attention to the greatly lengthened choir, commenced by Abbot John of York, 1203–11, and carried on by his successor, terminating, like Durham cathedral, in an eastern transept, the work of Abbot John of Kent, 1220–47, and to the tower (D), added not long before the dissolution by Abbot Huby, 1494–1526, in a very unusual position at the northern end of the north transept. The abbot's house, the largest and most remarkable example of this class of buildings in the kingdom, stands south to the east of the church and cloister, from which it is divided by the kitchen court (K), surrounded by the ordinary domestic offices. A considerable portion of this house was erected on arches over the Skell. The size and character of this house, probably, at the time of its erection, the most spacious house of a subject in the kingdom, not a castle, bespeaks the wide departure of the Cistercian order from the stern simplicity of the original foundation. The hall (2) was one of the most spacious and magnificent apartments in mediaeval times, measuring 170ft. by 70ft. Like the hall in the castle at Winchester, and Westminster hall, as originally built, it was divided by 18 pillars and arches, with 3 aisles. Among other apartments, for the designation of which we must refer to the ground-plan was a domestic oratory or chapel, (6) 46½ft. by 23ft. and a kitchen (7), 50ft. by 38ft.

**Feudal Character.**—The arrangement of the building bespeaks the powerful feudal lord, not the humble father of a body of hard-working brethren, bound by vows to a life of poverty and self-denying toil. In the words of Dean Milman, "the superior, once a man bowed to the earth with humility, care-worn, pale, emaciated, with a coarse habit bound with a cord, with naked feet, had become an abbot on his curvetting palfrey, in rich attire, with his silver cross before him, travelling to take his place amid the lordliest of the realm." (*Lat. Christ.* vol. iii. p. 330.)

The buildings of the *Austin canons* or *Black canons* (so called from the colour of their habit) present few distinctive peculiarities. This order had its first seat in England at Colchester, where a house for Austin canons was founded about A.D. 1105, and it very soon spread widely. As an order of regular clergy, holding a middle position between monks and secular canons, almost resembling a community of parish priests living under rule, they adopted naves of great length to accommodate large congregations

The *Premonstratensian* regular canons, or White canons, had as many as 35 houses in England, of which the most perfect remaining are those of Easby, Yorkshire, and Bayham, Kent. The head house of the order in England was Welbeck. This order was a reformed branch of the Austin canons, founded, A.D. 1119, by Norbert (born at Xanten, on the Lower Rhine, *c.* 1080) at Prémontré, a secluded marshy valley in the forest of Coucy in the diocese of Laon. The order spread widely. Even in the founder's lifetime it possessed houses in Syria and Palestine. It long maintained its rigid austerity, till in the course of years wealth impaired its discipline, and its members sank into indolence and luxury. The Premonstratensians were brought to England shortly after A.D. 1140, and were first settled at Newhouse, in Lincolnshire, near the Humber. The ground-plan of Easby abbey, owing to its situation on the edge of the steeply-sloping banks of the Swale, is singularly irregular. The cloister is duly placed on the south side of the church, and the chief buildings occupy their usual positions round it. But the cloister garth, as at Chichester, is not rectangular, and all the surrounding buildings are thus made to sprawl in a very awkward fashion. The church

follows the plan adopted by the Austin canons in their northern abbeys, and has only one aisle to the nave—that to the north, while the choir is long, narrow and aisleless. Each transept has an aisle to the east, forming three chapels.

The church at Bayham was destitute of aisles either to nave or choir. The latter terminated in a three-sided apse. This church is remarkable for its exceeding narrowness in proportion to its length Extending in longitudinal dimensions 257ft., it is not more than 25ft broad. Stern Premonstratensian canons wanted

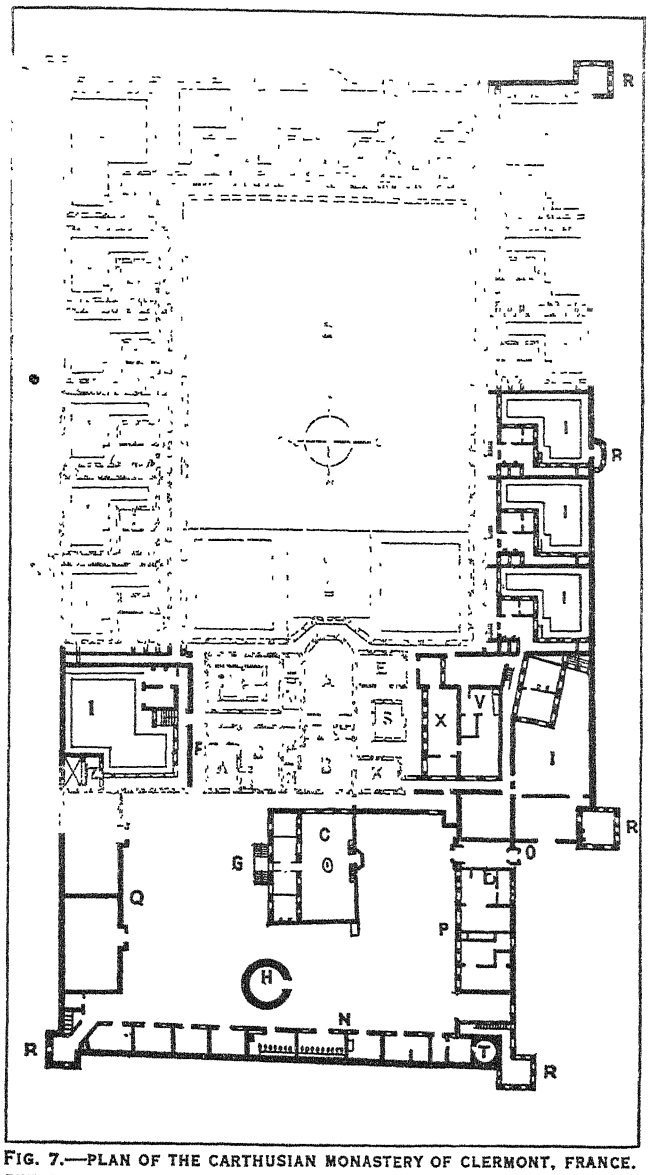

FIG. 7.—PLAN OF THE CARTHUSIAN MONASTERY OF CLERMONT, FRANCE. THE PRINCIPLES OF THE CARTHUSIAN ORDER DEMANDED A DISTINCT FORM OF MONASTIC INSTITUTION IN WHICH THE BROTHERHOOD COULD LIVE IN SOLITUDE AND SILENCE—HENCE THE SEPARATE CELLS

no congregations, and cared for no possessions; therefore they built their church like a long room.

**Carthusians.**—The *Carthusian* order, on its establishment by St. Bruno, about A.D. 1084, developed a greatly modified form and arrangement of a monastic institution. The principle of this order, which combined the coenobitic with the solitary life, demanded the erection of buildings on a novel plan. This plan, which was first adopted by St. Bruno and his twelve companions at the original institution at Chartreux, near Grenoble, was maintained in all the Carthusian establishments throughout Europe, even after the ascetic severity of the order had been to some extent relaxed, and the primitive simplicity of their buildings had been exchanged for the magnificence of decoration which characterizes such foundations as the *Certosas* of Pavia and Florence. According to the rule of St. Bruno, all the members of a Carthusian brotherhood lived in the most absolute solitude and silence. Each occupied a small detached cottage, standing by itself in a small garden surrounded by high walls and connected by a common corridor or cloister. In these cottages or cells a Carthusian monk passed his time in the strictest asceticism, only leaving his solitary dwelling to attend the services of the Church, except on certain days when the brotherhood assembled in the refectory. The peculiarity of the arrangements of a Carthusian monastery, or *charter-house*, as it was called in England, from a corruption of the French *chartreux*, is exhibited in the plan of that of Clermont, after Viollet-le-Duc.

**Clermont Abbey** is surrounded by a wall, furnished at intervals with watch towers (R). The enclosure is divided into two courts, of which the eastern court, surrounded by a cloister, from which the cottages of the monks (I) open, is much the larger. The two courts are divided by the main buildings of the monastery, including the church, the sanctuary (A), divided from B, the monks' choir, by a screen with two altars, the smaller cloister to the south (S) surrounded by the chapter-house (E), the refectory (X)—these buildings occupying their normal position—and the chapel of Pontgibaud (K). The kitchen with its offices (V) lies behind the refectory, accessible from the outer court without entering the cloister. To the north of the church, beyond the sacristy (L), and the side chapels (M), we find the cell of the sub-prior (A') with its garden. The lodgings of the prior (G) occupy the centre of the outer court, immediately in front of the west door of the church, and face the gateway of the convent (O). A small raised court with a fountain (C) is before it. This outer court also contains the guest-chambers (P), the stables, and lodgings of the lay brothers (N), the barns and granaries (Q), the dovecot (H), and the bakehouse (T). At Z is the prison. (In this outer court, in all the earlier foundations, as at Witham, there was a smaller church in addition to the larger church of the monks ) The outer and inner courts are connected by a long passage (F), wide enough to admit a cart laden with wood to supply the cells of the brethren with fuel. The number of cells surrounding the great cloister is 18. They are all arranged on a uniform plan. Each little dwelling contains three rooms: a sitting room (C), warmed by a stove in winter; a sleeping-room (D), furnished with a bed, a table, a bench, and a book-case; and a closet (E). Between the cell and the cloister gallery (A) is a passage or corridor (B), cutting off the inmate of the cell from all sound or movement which might interrupt his meditations. The superior had free access to this corridor, and through open niches was able to inspect the garden without being seen. At I is the hatch or turn-table, in which the daily allowance of food was deposited by a brother appointed for that purpose, affording no view either inwards or outwards. H is the garden, cultivated by the occupant of the cell. At K is the wood-house. F is a covered walk, with the necessary at the end.

The above arrangements are found with scarcely any variation in all the charter-houses of western Europe. The Yorkshire Charter-house of Mount Grace, founded by Thomas Holland, the young duke of Surrey, nephew of Richard II. and marshal of England, during the revival of the popularity of the order, about A.D. 1397, is the most perfect and best preserved English example.

**Mendicant Friars.**—An article on monastic arrangements would be incomplete without some account of the convents of the Mendicant or Preaching Friars, including the Black Friars or Dominicans, the Grey or Franciscans, the White or Carmelites, the Eremite or Austin Friars. These orders arose at the beginning of the 13th century, when the Benedictines, together with their various reformed branches, had terminated their active mission, and Christian Europe was ready for a new religious

revival. Planting themselves, as a rule, in large towns, and by preference in the poorest and most densely populated districts, the Preaching Friars were obliged to adapt their buildings to the requirements of the site. Regularity of arrangement, therefore, was not possible, even if they had studied it. Their churches, built for the reception of large congregations of hearers rather than worshippers, form a class by themselves, totally unlike those of the elder orders in ground-plan and character They were usually long parallelograms unbroken by transepts. The nave very usually consisted of two equal bodies, one containing the stalls of the brotherhood, the other left entirely free for the congregation. The constructional choir is often wanting, the whole church forming one uninterrupted structure, with a continuous range of windows. Taken as a whole, the remains of the establishments of the friars afford little warrant for the invective of Matthew Paris, benedictine of St. Albans. "The friars who have been founded scarcely 40 years have built residences as the palaces of kings These are they who, enlarging day by day their sumptuous edifices and encircling them with lofty walls, lay up in them their incalculable treasures, transgressing the bounds of poverty and violating the fundamental rules of their profession"

Hibbert, *The Dissolution of the Monasteries* (1910); C. W. New, *History of the Alien Priories in England* (1916). *See* the articles on the different orders.

**ABBON OF FLEURY** or ABBO FLORIACENSIS (*c.* 945–1004), French scholar. He spent two years in England, and was abbot of Romsey. After his return to France he was made abbot of Fleury on the Loire (988). He was twice sent to Rome by King Robert the Pious (986–96), and on each occasion succeeded in warding off a threatened papal interdict. He was killed at La Réole in 1004, in endeavouring to quell a monkish revolt. He wrote an *Epitome de vitis Romanorum pontificum*, besides controversial treatises, letters, etc. (*see* Migne, *Patrologiae Latina*). His life, written by his disciple Aimoin of Fleury, in which much of Abbon's correspondence was reproduced, is of great importance as a source for the reign of Robert II., especially with reference to the papacy (*cf.* Migne, *op. cit.* vol. cxxxix.).

*See* Ch. Pfister, *Études sur le règne de Robert le Pieux* (1885); Cuissard-Gaucheron, "L'École de Fleury-sur-Loire à la fin du 10e siècle," in *Mémoires de la société archéol. de l'Orléanais*, xiv. (Orleans, 1875); A. Molinier, *Sources de l'histoire de France.*

**ABBOT, CHARLES GREELEY** (1872– ), American astrophysicist, was born in Wilton, N.H., on May 31, 1872. He graduated in 1894 from the Massachusetts Institute of Technology, and after a year of graduate study there joined the staff of the astrophysical observatory of the Smithsonian Institution. Here he served first as assistant, 1895–96, and then as acting director in charge from 1896 until 1907, when he was appointed director. He made original investigations in solar physics, studying especially the infra-red solar spectrum, the solar constant of radiation, the variability of solar and terrestrial temperatures and the utilization of solar heat. In connection with his researches he conducted expeditions to observe total eclipses of the sun in 1900, 1901, 1908 and 1919. In collaboration with S. P. Langley he completed the mapping of the infra-red spectrum, published in the *Annals* (vol. i.) of the astrophysical observatory. With F. E. Fowle and L. B Aldrich he published also in the *Annals* (vol iii, iv.) proofs of the variability of the sun, as shown by experiments conducted simultaneously in California and Algeria and from observations made in expeditions to Arizona and Chile. In recognition of his discoveries he was awarded the Draper medal (1910) and the Rumford medal (1916). To scientific journals he has contributed numerous articles on the apparatus, methods and results of solar research. He published *The Sun* (1907), *Everyday Mysteries* (1923) and *The Earth and the Stars* (1925 and 1946). In 1918 he was made assistant secretary, and from 1928 to 1944 was secretary, of the Smithsonian institution

**ABBOT, EZRA** (1819–1884), U.S. biblical scholar, was born at Jackson, Me., April 28, 1819. He graduated at Bowdoin college in 1840; and, after being principal of a public school in Cambridge, became assistant librarian of Harvard university, and from 1872 until his death Bussey Professor of New Testament Criticism and Interpretation in the Harvard divinity school. His studies were chiefly in oriental languages and the textual criticism of the New Testament, though he was a remarkable bibliographer. His publications were largely dispersed in the pages of reviews and other publications, but to the enlarged American edition of Smith's *Dictionary of the Bible* (1867–70), he contributed more than 400 articles besides greatly improving the bibliographical completeness of the work. His principal single production, representing his scholarly method and conservative conclusions, was *The Authorship of the Fourth Gospel* (1880; second edition, by J. H. Thayer, with other essays, 1889), up to that time probably the ablest defence, based on external evidence, of the Johannine authorship, and certainly the most complete treatment of the relation of Justin Martyr to this gospel. He died in Cambridge, Mass, March 21, 1884.

*See* S. J. Barrows, *Ezra Abbot* (1884).

**ABBOT, GEORGE** (1562–1633), Archbishop of Canterbury, was born on Oct. 19, 1562, at Guildford, Surrey, the son of a cloth-worker. Educated at Balliol College, Oxford, he became master of University College (1597) and dean of Winchester (1600).

He was one of those who prepared King James's Version of the Bible. James I. sent him to Scotland in 1608 to arrange for the establishment of episcopacy there. On his return he was preferred to the bishopric of Lichfield and Coventry (1609), London (1609) and Canterbury (1611). As vice-chancellor of the University of Oxford at different times between 1600 and 1605, he had come into conflict with Laud, and at court he supported Puritan measures. He promoted the marriage between the Elector Palatine and Princess Elizabeth, and resisted the proposal for the marriage of the Prince of Wales to the Spanish infanta.

Under Charles I. he was suspended from his functions of primate for refusing to license the Assize sermon preached by Robert Sibthorp at Northampton (Feb. 22, 1627), advocating non-resistance to the royal demands, however arbitrary. He died at Croydon, Aug. 5, 1633, and was buried at Guildford, where he had endowed a hospital. Abbot's later years were clouded by the fact that in 1622 he had accidentally shot a keeper while hunting. His enemies maintained that the homicide, though accidental, disqualified him from office, and the matter had to be referred to a commission, on which King James had to exercise his casting vote in the archbishop's favour.

**ABBOT, WILLIAM** (1798–1843), English actor, was born in Chelsea, and made his first appearance on the stage at Bath in 1806, and his first London appearance in 1808. He created the parts of Appius Claudius in Sheridan Knowles's *Virginius* (1820) and of Modus in his *Hunchback* (1832). In 1827 he organized the company, including Macready and Miss Smithson, which acted Shakespeare in Paris. Two of Abbot's melodramas, *The Youthful Days of Frederick the Great* (1817) and *Swedish Patriotism* (1819), were produced at Covent Garden. He died in poverty at Baltimore, Maryland.

**ABBOT,** the head and chief governor of a community of monks, called also in the East *hegumenos* or *archimandrite*. The title abbot is derived ultimately from the Hebrew *ab*, "father," through

the Syriac *abbas,* and had its origin in the monasteries of Syria, whence it spread through the East, and soon became accepted in all languages as the designation of the head of a monastery. But though general in the West, it was never universal. Among the Dominicans, Carmelites, Augustinians, etc., the superior was called *Prior;* among the Franciscans, *Custos* ("guardian").

In Egypt, the first home of monasticism, the abbot or archimandrite sometimes ruled over only one community, sometimes over several, each of which had its own abbot as well. By the rule of St. Benedict, which, until the reform of Cluny, governed monasticism in the West, the abbot has jurisdiction over only one community. The rule was subject to frequent violations; but it was not until the foundation of the Cluniac Order that the idea of a supreme abbot, exercising jurisdiction over all the houses of an order, was definitely recognized. New styles expressed this new relation; thus the abbot of Monte Cassino was called *abbas abbatum* ("abbot of abbots"), while the chiefs of other orders had the titles *abbas generalis* ("abbot general"), or *magister* ("master") or *minister generalis* ("minister general").

Monks, as a rule, were laymen, nor at the outset was the abbot any exception. All orders of clergy, therefore, took precedence of him. For religious offices the abbot and his monks were commanded to attend the nearest church.

Abbots were originally subject to episcopal jurisdiction, and continued generally so in the West till the 11th century. The first case recorded of the partial exemption of an abbot from episcopal control is that of Faustus, abbot of Lerins, at the council of Arles, A.D. 456; but the exorbitant claims and exactions of bishops rendered it increasingly frequent, and, in the 6th century, the practice of making religious houses responsible to the Pope alone received an impulse from Gregory the Great. These exceptions, introduced with a good object, had grown into a widespread evil by the 12th century, the bishop being deprived of all authority over the chief centres of influence in his diocese. Abbots more and more assumed almost episcopal state, and adopted the episcopal insignia of mitre, ring, gloves and sandals, a custom which arose out of the granting by the Pope of the right to wear the mitre to particular distinguished abbots.

The first undoubted instance is the bull by which Alexander II. in 1063 granted the use of the mitre to Egelsinus, abbot of St. Augustine at Canterbury (*see* MITRE).

The adoption of episcopal insignia by abbots was followed by an encroachment on episcopal functions, which was ineffectually guarded against by the Lateran Council, A.D. 1123. In A.D. 1489 they were permitted by Innocent IV. to confer both the subdiaconate and diaconate. They always and everywhere had the power of admitting their own monks and vesting them with the religious habit. Originally the bishop of the diocese chose the abbot out of the monks of the convent, but the right of election was transferred by jurisdiction to the monks themselves, reserving to the bishop the confirmation of the election and the benediction of the new abbot. In abbeys exempt from episcopal jurisdiction the confirmation and benediction had to be conferred by the Pope in person, the house being taxed with the expenses of the new abbot's journey to Rome. An abbot had to be at least 25 years of age, of legitimate birth, and a monk of the house, unless it furnished no suitable candidate. The election was for life, unless the abbot was canonically deprived by the chiefs of his order, or, when he was directly subject to them, by the Pope or the bishop. The power of the abbot was absolute, limited only by the canons of the church and, until the general establishment of exemptions, by episcopal control. As a rule, however, implicit obedience was enforced.

The abbot was treated with the utmost reverence by the brethren of his house. If he gave a command, the monk receiving it was to kneel. No monk might sit in his presence, or leave it without his permission. In the East he was commanded to eat with the other monks. In the West the rule of St. Benedict appointed him a separate table, at which he might entertain guests and strangers. This permission opening the door to luxurious living, the Council of Aix, A.D. 817, decreed that the abbot should dine in the refectory on the same fare as the monks, unless he had to entertain a guest. These ordinances proved, however, generally ineffectual, and contemporaneous literature abounds with satirical remarks and complaints concerning the inordinate extravagance of the tables of the abbots

The ordinary dress of the abbot was according to rule to be the same as that of the monks But by the 10th century the rule was commonly set aside, and we find frequent complaints of abbots adopting sumptuous attire. They sometimes even laid aside the monastic habit altogether With the increase of wealth and power, abbots, in fact, lost much of their religious character, and vied in magnificence with the first nobles of the realm They rode on mules with gilded bridles, rich saddles and housings, carrying hawks on their wrists, followed by an immense train of attendants. They associated on equal terms with laymen of the highest distinction, and shared all their pleasures and pursuits This rank and power was, however, often used most beneficially. For instance, Richard Whiting, the last abbot of Glastonbury, judicially murdered by Henry VIII. in 1539, educated in his household as many as 300 sons of noblemen and gentlemen, besides others of a meaner rank, whom he fitted for the universities The abbots of Cluny and Vendôme were, by virtue of their office, cardinals of the Roman church.

In process of time the title abbot was improperly transferred to clerics who had no connection with the monastic system, as to the principal of a body of parochial clergy. It even came to be adopted by purely secular officials. Thus the chief magistrate of the republic at Genoa was called *Abbas Populi* ("the abbot of the people"). Lay abbots were the outcome of the growth of the feudal system from the 8th century onwards. The practice of *commendation,* by which (to meet a temporary emergency) the revenues of the community were handed over to a lay lord and in return for his protection, early suggested to the emperors and kings the expedient of rewarding their warriors with rich abbeys held *in commendam.* During the Carolingian epoch the custom grew up of granting these as regular heritable fiefs or benefices, and by the 10th century the system was firmly established. The example of the kings was followed by the feudal nobles, sometimes by making a temporary concession permanent, sometimes without any form of commendation whatever.

These lay abbacies were not merely a question of overlordship but implied the concentration in lay hands of all the rights, immunities and jurisdiction of the foundations; *i.e.,* the more or less complete secularization of spiritual institutions. The lay abbot took his recognized rank in the feudal hierarchy, and was free to dispose of his fief as in the case of any other.

In conventual cathedrals, where the bishop occupied the place of the abbot, the functions usually devolving on the superior of the monastery were performed by a prior.

The title *abbé* (French), as commonly used in the Roman Catholic church on the European continent, is the equivalent of the English "Father," being loosely applied to all who have received the tonsure. In the German Evangelical church the title of abbot (*Abt*) is sometimes bestowed, like *abbé,* as an honorary distinction, and sometimes survives to designate the heads of monasteries converted at the Reformation into collegiate foundations. Of these the most noteworthy is the abbey of Lokkum in Hanover, founded as a Cistercian house in 1163 by Count Wilbrand of Hallermund, and reformed in 1593.

Benoit jusqu'à S. Bernard* (1860–77); Achille Luchaire, *Manuel des institutions françaises* (Paris, 1892).

**ABBOTSFORD,** former residence of Sir Walter Scott, on south bank of the Tweed, about 3m. W. of Melrose, Roxburghshire, Scotland, and nearly 1m. from Abbotsford Ferry Station, L.N.E.R branch line. Cartleyhole, nicknamed Clarty (muddy) Hole, a farm of 100ac., was bought by Scott (1811) when his lease of Ashestiel, near by, lapsed; he added to it and finally bought Toftfield (afterwards Huntlyburn) in 1817, building his house in Scottish baronial style with relics from historical structures such as the doorway of the old Tolbooth in Edinburgh. A reverse of

fortune in 1825 involved Scott in debt, but the creditors made him a free gift of the library in 1830 and Robert Cadell the publisher cancelled all mortgages in 1847 in exchange for the family's share in the copyright of Sir Walter's works. The house remained in the hands of the Maxwell-Scotts, descendants of Scott. Abbotsford gave its name to the Abbotsford club, a successor of the Bannatyne and Maitland clubs, founded by W. B. D. D. Turnbull in 1834 in Scott's honour, for printing and publishing historical works connected with his writings. Its publications extended from 1835 to 1864.

**ABBOTT, EDWIN ABBOTT** (1838–1926), English schoolmaster and grammarian, succeeded G. F. Mortimer as headmaster of the City of London School in 1865. He was the author of a *Shakespearian Grammar* (1870), which is a permanent contribution to English philology, and of many theological works, among them the article on the Gospels in the 9th ed. of the *Encyclopædia Britannica.*

His brother, Evelyn Abbott (1843–1901), was a tutor of Balliol, Oxford, and author of a scholarly *History of Greece.*

**ABBOTT, EMMA** (1849–1891), American singer, was born in Chicago, Ill., and studied in Milan and Paris. She had a fine soprano voice, and appeared first in opera in London at Covent Garden, also singing at important concerts. She organized an opera company known by her name, and toured extensively in the United States, where she had a great reputation. In 1873 she married E. J. Wetherell. She died at Salt Lake City (Utah), Jan. 5, 1891.

**ABBOTT, GEORGE** (1889– ), American playwright, was born in Forestville, N.Y., on June 25, 1889. He graduated at the University of Rochester (1911), where he wrote and acted for the dramatic club. The following year he studied dramatic writing with Prof. George Pierce Baker at Harvard, had a one-act play produced by the Harvard dramatic club, and won a prize play contest at the Keith Bijou theatre. In order to learn more about the stage and before having any plays accepted for professional productions he became an actor. He appeared in important rôles in *Zander the Great,* with Alice Brady; *Hell Bent for Heaven* and *Processional,* where his acting of the blinded Ishmaelite was particularly outstanding, and other Broadway productions. His first play to be produced, *Fall Guy* (published in the *Best Plays of 1924–25*), was written in collaboration with James Gleason; the next, *Love 'Em and Leave 'Em,* with John V. A. Weaver; *The Holy Terror,* with Winchell Smith; and *Four Walls,* with Dana Burnet. His *Broadway,* written with Phillip Dunning, was one of the dramatic successes of 1926–27 as was *Coquette* (with Ann Preston Bridgers) in 1927–28 and *Three Men on a Horse* (with J. C. Holm) eight years later. He also became well known as a producer of plays and motion pictures.

**ABBOTT, GRACE** (1878–1939), U.S. social reformer, was born in Grand Island, Neb., Nov. 17, 1878. She took her bachelor's degree from Grand Island college in 1898 and her master's degree from The University of Chicago in 1909. In 1908 she went to Hull House, Chicago, as director of the new Immigrants' Protective league. While director of the child-labour division, U.S. children's bureau (1917–19), she administered the first federal child-labour law. She was secretary of the Illinois State Immigrants' commission (1919–21) and chief of the U.S. children's bureau (1921–34), where she administered the Maternity and Infancy act (1922–29). She was U.S. delegate to the International Labour organization in 1935 and 1937 and was professor of public welfare at The University of Chicago from 1934 to 1939. She died June 19, 1939.

She wrote *The Immigrant and the Community* (1917), *Reports of Chief of Children's Bureau* (1922–34), *The Child and the State,* 2 vol. (1938), and *From Relief to Social Security* (1940). (E. Ab.)

**ABBOTT, JACOB** (1803–1879), American writer of books for the young, was born at Hallowell (Me.) on Nov. 14, 1803. He graduated at Bowdoin college in 1820; studied at Andover Theological Seminary. He was tutor in 1824–25, and from 1825 to 1829 was professor of mathematics and natural philosophy in Amherst college; was licensed to preach by the Hampshire Association in 1828; founded the Mt. Vernon School for young ladies in Boston in 1829, and was principal until 1833; was pastor of Eliot Congregational church (which he founded) at Roxbury (Mass.), in 1834–35; and was, with his brothers, a founder, and in 1843–51 a principal, of Abbott's Institute, and in 1845–48 of the Mt. Vernon School for boys, in New York city. He was a prolific author, writing juvenile stories, brief histories and biographies, and religious books for the general reader, and a few works in popular science. He died on Oct. 31, 1879, at Farmington (Me.), where he had spent part of his time since 1839. The best known of his writings are those which feature the boyish paragon Rollo—*Rollo at Work, Rollo at Play, Rollo in Europe,* etc. (28 vol.). In these didactic tales Abbott did for one or two generations of young American readers a service not unlike that performed earlier by the author of *Sandford and Merton.* Of his other writings the best are the *Franconia Stories* (10 vol.), 22 vol. of biographical histories and the *Young Christian.*

*See* his *Young Christian, Memorial Edition. with a Sketch of the Author by One of His Sons; i e,* Edward Abbott (1882), with a bibliography of his works; also Lyman Abbott, *Silhouettes of My Contemporaries* (1921).

**ABBOTT, SIR JAMES** (1807–1896), British soldier, educated at the Military college, Addiscombe. He served in the Bengal artillery at the siege of Bhurtpore. 1825–26. He was the first Englishman to visit Khiva, where he was sent on a mission in 1839. During the Sikh war of 1848–49, he held Hazara, of which he was commissioner (1847–54). He died Oct. 6, 1896.

*See* J. Abbott, *Narrative of a Journey from Heraut to Khiva,* 2 vol., 3rd ed. (London, 1884).

**ABBOTT, JOHN STEVENS CABOT** (1805–1877), American writer, was born in Brunswick, Me., on Sept. 18, 1805. He was a brother of Jacob Abbott, with whom he was associated in the management of Abbott's Institute, New York city, and in the preparation of his series of brief historical biographies. He is best known, however, as the author of a partisan and unscholarly but very readable *History of Napoleon Bonaparte* (1855). Dr. Abbott graduated at Bowdoin college in 1825, studied at Andover theological seminary, and between 1830 and 1844, when he retired from the ministry, preached successively at Worcester, Roxbury and Nantucket, Massachusetts. He died at Fair Haven, Conn., on June 17, 1877. He was a voluminous writer of books on Christian ethics, and of popular histories.

**ABBOTT, LYMAN** (1835–1922), American divine and author, was born at Roxbury (Mass.), on Dec. 18, 1835, the son of Jacob Abbott. He graduated at New York university in 1853, studied law, and was admitted to the bar in 1856; but abandoning the legal profession, after studying theology with his uncle, J. S. C. Abbott, he was ordained a minister of the Congregational church in 1860. After pastorates in Terre Haute (Ind.), and New York City, he became an associate editor of *Harper's Magazine,* editor of the *Illustrated Christian Weekly,* and co-editor (1876–81) of *The Christian Union* with Henry Ward Beecher, whom he succeeded in 1888 as pastor of Plymouth church, Brooklyn. From this pastorate he resigned 11 years later. From 1881 he was editor-in-chief of *The Christian Union,* renamed *The Outlook* in 1893; this periodical reflected his efforts toward social reform and his humane and liberal theology. To the end of his long life he continued to take an active and authoritative part in the discussion of public questions. He died in New York City on Oct. 22, 1922.

The serenity and dignity of his life are reflected in his works which include, besides his many magazine articles, *Jesus of Nazareth* (1869); *Evolution of Christianity* (Lowell Lectures, 1896); *The Theology of an Evolutionist* (1897); *Christianity and Social Problems* (1897); *Life and Letters of Paul* (1898); *Problems of Life* (1900); *The Rights of Man* (1901); *Henry Ward Beecher* (1903); *The Christian Ministry* (1905); *The Personality of God* (1905); *Industrial Problems* (1905); *America in the Making* (1911); and *Reminiscences* (1915).

**ABBOTT, WILBUR CORTEZ** (1869–1947), U.S. educator and historian, was born in Kokomo, Ind., Dec. 28, 1869. Following his graduation from Wabash college, Crawfordsville, Ind., in 1892, he pursued graduate studies at Cornell university and in Europe. Upon returning from Europe, he taught history at the University of Michigan, Ann Arbor, 1897–99. Abbott was assistant professor of history at Dartmouth college, Hanover,

N.H., 1899–1902; professor of European history at the University of Kansas, Lawrence, 1902–08; and professor of history at Yale university, 1908–20, and at Harvard university, 1920–37. He was a research associate in history at Yale, 1938–46. He died on March 27, 1947. Among his published works are *The Expansion of Europe* (1918); and (ed, with others) *The Writings and Speeches of Oliver Cromwell*, 4 vol. (1937–47).

**ABBOTTABAD**, a town of Pakistan, 4,120 ft above sea level, 63 mi from Rawalpindi, formerly the headquarters of the Hazara district in the North-West Frontier province, called after its founder, Sir James Abbott, who settled this wild district after the annexation of the Punjab. Pop (1941) 27,424. It was an important military cantonment and sanatorium, being the headquarters of a brigade in the Rawalpindi division of the northern Indian army It is remarkable for the rock inscription of Asoka close by

**ABBREVIATION.** Strictly a shortening, an abbreviation more particularly is a letter or group of letters taken from a word or words and employed to represent it or them for the sake of brevity. Abbreviations, both of single words and of phrases, having a meaning more or less fixed and recognized, were common in ancient writings and inscriptions (*see* PALAEOGRAPHY). A common form of abbreviation is the substitution for a word of its initial letter, but one or more of the other letters are frequently added. Letters are often doubled to indicate a plural or a superlative There is no occasion to explain here the common abbreviations for Christian names or for geographical place names (listed separately in vol. 24) or for the chemical elements (listed separately under ATOMIC WEIGHTS) Also omitted are those abbreviations which have passed into common usage as words in their own rights; *e g*, Cominform, gestapo, radar, etc.

No universally accepted rule as to the use of periods in abbreviations has been followed One common method, and the one used in this article, is to use periods after the initials of all organizations except U S. government agencies and some, but not all, organizations whose letters form pronounceable words such as WAVES, etc.

In cases where the abbreviation has multiple meanings, only the most common are given.

## COMMON ABBREVIATIONS

| | |
|---|---|
| a. | alto, adjective; answer; accepted |
| A | angstrom, the international wave-length unit, 1938 |
| Å | Ångström scale of wave lengths, 1868–1938 |
| A1 | first class |
| AA | anti-aircraft |
| AAA | Agricultural Adjustment administration |
| A A A. | American Automobile association |

| A F. | Anglo-French |
| A F C. | air force cross (Brit.) |
| A F M. | air force medal (Brit); American Federation of Musicians |
| A F. of L. | American Federation of Labor |
| A G.F. | army ground forces |
| agr, agric. | agriculture; agricultural |
| agt. | agent |
| a h | ampere hour(s) |
| A.H. | (*anno Hegirae*) in the year of the hegira (Mohammedan era) |
| A I.A. | American Institute of Architects |
| A I.E E. | American Institute of Electrical Engineers; associate of the Institution of Electrical Engineers (Brit.) |
| A.I.F. | Australian imperial force |
| A.I M. & M.E. | American Institute of Mining and Metallurgical Engineers |
| A L. | American Legion |
| A L A. | American Library association |
| Ald. | alderman |
| A.L of H | American Legion of Honor |
| A.L P. | American Labor party |
| alt. | altitude; alternate |
| AM | amplitude modulation |
| Am, Amer. | American |
| A.M. | (*ante meridiem*) before noon; (*anno mundi*) in the year of the world; master of arts |
| A M A. | American Medical association |
| Amg | Allied military government of occupied territory |
| amp. | ampere(s) |
| amt. | amount(s) |
| Amvets | American Veterans of World War II |
| A N | Anglo-Norman |
| A N.A. | associate of the National Academy of Design |
| anal. | analysis |
| anc. | ancient |
| A.N.C. | army nurse corps |
| *and.* | (*andante*) moderately slow |
| Angl. | Anglican |
| anon. | anonymous |
| ans. | answer |
| ant. | antonym |
| ant, antiq. | antiquities; antiquarian |
| Anzac | Australian and New Zealand army corps |
| A.O H. | Ancient Order of Hibernians |
| A P | Associated Press |
| A P I | American Petroleum institute |
| A P O. | army post office |
| app. | appointed; appendix; apparent |
| approx | approximately |
| A.Q.M G | assistant quartermaster general |
| Ar, Arab. | Arabic; Arabian |
| A R A. | associate of the Royal Academy; American Railway association |
| A R C. | American Red Cross |
| arch | architecture; archaic |
| Archd | archdeacon; archduke |
| A R.C.M. | associate, Royal College of Music (Brit) |
| A.R.C.S. | associate, Royal College of Science (Brit) |
| arg | argent (heraldic) |
| A R I B A. | associate of the Royal Institute of British Architects |
| arith. | arithmetic, arithmetical |
| Arm. | Armoric |
| A R P | air-raid precautions |
| A.R.S.A. | associate of the Royal Scottish academy |
| A.R V | American revised version (Bib.) |
| AS, A.S. | Anglo-Saxon |
| ASCAP | American Society of Composers, Authors and Publishers |
| A.S C.E. | American Society of Civil Engineers |
| A.S.F. | army service forces |
| A.S M.E. | American Society of Mechanical Engineers |
| ass., assn., assoc. | association |
| asst. | assistant |
| ASTP | Army Special Training program |
| astr, astron. | astronomical; astronomy |
| AT | anti-tank |
| ATC | air transport command |
| atm. | atmosphere(s); atmospheric |
| A T.S. | auxiliary territorial service (Brit.) |
| atty. | attorney |
| Atty. Gen. | attorney general |
| at. wt. | atomic weight |
| A.U. | angstrom unit, 1938 |
| Å.U. | Ångström unit, 1868–1938 |
| A.U.C. | (*anno urbis conditae*) from the founding of the city (Rome) |
| av., ave. | avenue; average |
| A.V. | authorized version of the Bible |
| A.V.C. | American Veterans committee |
| avoir. | avoirdupois |

| | |
|---|---|
| A W O L | absent without leave |
| AWVS | American Women's Voluntary services |
| b. | born |
| B.A. | bachelor of arts |
| bal. | balance |
| Bapt. | Baptist |
| B.Arch. | bachelor of architecture |
| bart., bt. | baronet |
| B B.C. | British Broadcasting corporation |
| bbl. | barrel(s) |
| B C. | before Christ |
| BCG | Bacillus-Calmette Guérin |
| B D. | bachelor of divinity |
| bd ft. | board foot; board feet |
| Bé. | Baumé (degrees) |
| B Ed. | bachelor of education |
| B E.F. | British expeditionary force |
| BES | bureau of employment security |
| BEW | Board of Economic Warfare |
| b.f. | boldface |
| b h p. | brake horsepower |
| Bib., bibl. | Bible, biblical |
| bibliog. | bibliography, bibliographer |
| biog. | biography; biographical |
| bk. | bank, book, bark |
| bkt. | basket(s) |
| b l. | bill of lading |
| bldg. | building |
| B L.E. | [illegible] of Locomotive Engineers |
| blk. | black; block |
| BLS | bureau of labour statistics |
| blvd, boul. | boulevard |
| b m. | board measure |
| B M | bachelor of medicine |
| B.M.I. | Broadcast Music, Inc. |
| bn | battalion |
| B.O A.C. | British Overseas Airways corporation |
| b.p | boiling point |
| Bp | bishop |
| B P.O.E. | Benevolent and Protective Order of Elks |
| Brig. | brigade; brigadier |
| Brig. Gen. | brigadier general |
| Brit. | British |
| Bros. | brothers |
| B.S, B.Sc. | bachelor of science or sciences |
| B S A. | Boy Scouts of America |
| B Th. | bachelor of theology |
| B.T.U. | British thermal unit(s) |
| bu | bushel(s) |
| bull. | bulletin |
| B V.M. | the Blessed Virgin Mary |
| bx. | box(es) |
| *c.* | (*circa*) about |
| c., ¢, ct. | cent |
| c., *cap.*, ch., chap. | (*caput*) chapter |
| C. | centigrade |
| C.A. | chartered accountant; coast artillery |
| CAA | Civil Aeronautics administration |
| CAB | Civil Aeronautics board |
| cal. | calorie(s) |
| Cantab. | (*Cantabrigiensis*) of Cambridge (university) |
| Capt. | captain |
| car., k. | carat(s) |
| Card. | cardinal |
| cat. | catalogue |
| Cath. | Catholic; cathedral |
| cav. | cavalry |
| C.B. | Companion (of the Order) of the Bath (Brit.) |
| C.B.E. | Commander, Order of the British Empire |
| CBS | Columbia Broadcasting system |
| c.c. | cubic centimetre(s) |
| CCC | Civilian Conservation corps; Commodity Credit corporation |
| C.D.S., D.S.O. | Companion of the Distinguished Service Order (Brit.) |
| C.E. | civil engineer; Christian Endeavor; Church of England |
| CEA | Commodity Exchange authority |
| C.E D. | Committee for Economic Development |
| C E F. | Canadian expeditionary force |
| Celt. | Celtic |
| cent | (*centum*) a hundred |
| *cet. par.* | (*ceteris paribus*) other things being equal |
| *cf.* | compare |
| C G. | coast guard |
| cg | centigram(s) |
| c g s, C G S. | centimetre-gram-second(s) |
| C G T. | (*Confédération Générale du Travail*) General Confederation of Labour (Fr) |
| C H. | Companion of Honour (Brit.) |
| ch. | church |
| Chap. | chaplain |
| Chem.E. | chemical engineer |
| C.I E. | Companion (of the Order) of the Indian Empire (Brit.) |
| Cie | (*compagnie*) company |
| c i f | cost, insurance, freight |
| C I O. | Congress of Industrial Organizations |
| cl | centilitre(s) |
| clk | clerk |

**ABBREVIATORS,** officials in the papal chancery, whose business was to draft the pope's bulls, briefs and consistorial decrees before these were written out *in extenso* by the *scriptores.* They are first mentioned in *Extravagantes* of John XXII. Pius II fixed their number at 70, and formed them into a college of prelates Pius VII reduced their number to 17. The college was abolished in 1908 by Pius X, who transferred its duties to the *Collegium Pronotariorum Apostolicorum.* (*See* CURIA ROMANA.)

**A.B.C. POWERS,** a designation which came into use shortly before World War I for the three leading South American powers—Argentina, Brazil and Chile. For many years previously a current of opinion had prevailed in several republics of South America favouring an alliance to counteract certain political tendencies of the United States and particularly the Monroe Doctrine. Recalling unsettled boundaries and other political problems, statesmen of certain Latin American republics had, from

time to time, provided for arbitration agreements or other means of mutual assistance in case of emergencies. Among such was the treaty between Brazil and Chile in 1899; between Argentina and Chile in 1902; and between Argentina and Brazil in 1905. These pacts have been regarded as the forerunners of the three-power *entente cordiale* that gradually developed and was discussed at the first Pan-American Scientific Congress, held at Santiago, Chile, in 1908–09. In 1915 Argentina, Brazil and Chile concluded among themselves a group of treaties of peace and arbitration

On April 25, 1914, when war between the United States and Mexico appeared imminent, the Governments of Argentina, Brazil and Chile, through their diplomatic representatives at Washington, Dr. Rómulo S Naón, Sr. Domicio da Gama, and Don Eduardo Suárez, respectively, addressed the secretary of State of the United States tendering their services as mediators. This mediation was accepted by President Woodrow Wilson, who appointed as United States delegates Justice Joseph R. Lamar and Frederick W. Lehmann, while Mexico chose as her representatives Sres. Emilio Rabasa, Augustin Rodriguez and Luis Elguero These A B.C. mediators, together with the Americans and the Mexicans, met in a series of sessions at Niagara Falls, Canada. The deliberations began on May 18, 1914, and were continued until August of the same year The result of the conference was thus summarized by the Brazilian delegate, Senhór da Gama, as follows: "We have established, through agreement between the parties most directly interested, and in complete harmony with the sentiments of the Government of the United States, that it is a principle of American policy to have our national problems always given a fair examination and settled without foreign interference" (W. A. R)

**ABDALLATIF** or ABD-UL-LATIF (1162–1231), physician and traveller, was born and died in Baghdad. A memoir of Abdallatif, written by himself, has been preserved with additions by Ibn-Abu-Osaiba (Ibn abī Usaibia), a contemporary. He visited Mosul, Damascus and Egypt and then joined the circle of learned men whom Saladin gathered around him at Jerusalem. He taught medicine and philosophy at Cairo and at Damascus for a number of years, and afterwards, for a shorter period, at Aleppo.

Of the numerous works—mostly on medicine—which Osaiba ascribes to him, one only, his graphic and detailed *Account of Egypt*, appears to be known in Europe. The manuscript, discovered by Edward Pococke, the Orientalist, and preserved in the Bodleian Library, contains a vivid description of a famine caused by the Nile failing to overflow its banks. It was translated into Latin by Professor White of Oxford in 1800 and into French, with valuable notes, by De Sacy in 1810.

**'ABD-AR-RAHMAN,** the name borne by five princes of the Omayyad dynasty, amirs and caliphs of Cordova.

'ABD-AR-RAHMAN I. (756–788) founded the branch of the family which ruled for nearly three centuries in Mohammedan Spain. When the Omayyads were overthrown in the East by the Abbasids, 'Abd-ar-Rahman ibn Moawya, grandson of the caliph Histrām, was a young man of about 20 years of age. Together with his brother Yahya, he took refuge with Bedouin tribes in the desert. The Abbasids hunted their enemies down without mercy. Yahya was slain, and 'Abd-ar-Rahman saved himself by fleeing first to Syria and thence to northern Africa which had fallen into the hands of local rulers, formerly amirs or lieutenants of the Omayyad caliphs, but now aiming at independence. In the midst of all his perils, which read like stories from the *Arabian Nights*, 'Abd-ar-Rahman had been encouraged by a prophecy of his great-uncle Maslama that he would restore the fortunes of the family. He was followed in all his wanderings by a few faithful clients of the Omayyads. In 755 he was in hiding near Ceuta, and he sent an agent over to Spain to ask for the support of other clients of the family, descendants of the conquerors of Spain, who were numerous, in the province of Elvira, the modern Granada. On the invitation of his partisans he landed at Almuñecar, to the east of Malaga, on Aug. 14, 755. In the course of 756 a campaign was fought in the valley of the Guadalquivir, which ended, on May 16, in the defeat of the emir Yūsuf outside Cordova. 'Abd-ar-Rahman's army was so ill provided that he mounted almost the only good war-horse in it; he had no banner, and one was improvised by unwinding a green turban and binding it round the head of a spear The turban and the spear became the banner of the Spanish Omayyads. Yūsuf recognized 'Abd-ar-Rahman as emir of Spain in July 756.

'ABD-AR-RAHMAN II. (822–852), son of the emir Hakam, was one of the weaker of the Spanish Omayyads He was a prince with a taste for music and literature.

'ABD-AR-RAHMAN III (912–961) was the greatest and the most successful of the princes of his dynasty in Spain He succeeded his grandfather 'Abdallāh when he was barely 22 and reigned for half a century. 'Abd-ar-Rahman III came to the throne when the country was exhausted by more than a generation of tribal conflict among the Arabs, and of strife between them and the Mohammedans of native Spanish descent. Spaniards who were openly or secretly Christians had acted with the renegades. These elements were not averse from supporting a strong ruler who would protect them against the Arab aristocracy. These restless nobles were the most serious of 'Abd-ar-Rahman's enemies. Next to them came the Fatimites of Egypt and northern Africa, who claimed the caliphate, and who aimed at extending their rule over the Mohammedan world, at least in the west. 'Abd-ar-Rahman subdued the nobles by means of a mercenary army, which included Christians. He repelled the Fatimites, partly by supporting their enemies in Africa and partly by claiming the caliphate for himself. His ancestors in Spain had been content with the title of sultan. The caliphate was thought only to belong to the prince who ruled over the sacred cities of Mecca and Medina But the force of this tradition had been so far weakened that 'Abd-ar-Rahman could proclaim himself caliph on Jan. 16, 929. His worst enemies were always his fellow Mohammedans. After he was defeated by the Christians at Alhandega in 939 through the treason of the Arab nobles in his army he never again took the field

In the agony of the Omayyad dynasty in Spain, two princes of the house were proclaimed caliphs for a very short time, 'Abd-ar-Rahman IV. Mortada (1017), and 'Abd-ar-Rahman V. Mostadir (1023–24). Both were the mere puppets of factions, who deserted them at once. 'Abd-ar-Rahman IV. was murdered in the year in which he was proclaimed, at Guadiz, when fleeing from a battle in which he had been deserted by his supporters. 'Abd-ar-Rahman V. was proclaimed caliph in Dec. 1023 at Cordova, and murdered in Jan. 1024 by a mob of unemployed workmen, headed by one of his own cousins.

The history of the Omayyads in Spain is the subject of the *Histoire des Musulmans d'Espagne* by R. Dozy (Leyden, 1861). *See* also SPAIN: *From* A.D. *406 to the Conquest of Granada.*

**ABD-EL-AZIZ IV.** (1878–1943), sultan of Morocco, son of Sultan Mulai el Hasan III. by a Circassian wife He was 16 years of age on his father's death in 1894. By the wise action of Si Ahmad bin Musa, the chamberlain of el Hasan, Abd-el-Aziz's accession to the sultanate was ensured with but little fighting. Si Ahmad became regent and for six years showed himself a capable ruler. On his death in 1900 the regency ended, and Abd-el-Aziz took the reins of government into his own hands, with an Arab from the south, el Menebhi, for his chief adviser. Urged by his Circassian mother, the sultan sought advice and counsel from Europe and endeavoured to act up to it. But disinterested advice was difficult to obtain, and in spite of the unquestionable desire of the young ruler to do the best for the country, wild extravagance both in action and expenditure resulted, leaving the sultan with depleted exchequer and the confidence of his people impaired. His intimacy with foreigners and his imitation of their ways were sufficient to rouse fanaticism and create dissatisfaction. Europeans were accused of having spoiled the sultan and of being desirous of spoiling the country. When British engineers were employed to survey the route for a railway between Mequinez and Fez this was reported as indicating an absolute sale of the country. The fanaticism of the people was aroused and a revolt broke out near the Algerian frontier. Such was the condition of things when the news of the Anglo-French Agreement of 1904 came as a blow to Abd-el-Aziz, who had relied

on England for support and protection against the inroads of France. On the advice of Germany he proposed the assembly of an international conference at Algeciras in 1906 to consult upon methods of reform, the sultan's desire being to ensure a condition of affairs which would leave foreigners with no excuse for interference in the control of the country. The sultan gave his adherence to the Act of the Algeciras Conference, but the state of anarchy into which Morocco fell during the latter half of 1906 and the beginning of 1907 exposed the weakness of his government. In May 1907 the southern tribes invited Mulai Hafid, an elder brother of Abd-el-Aziz, and viceroy at Marrakesh, to become sultan, and in the following August Hafid was proclaimed sovereign. In the meantime the murder of Europeans at Casablanca had led to the occupation of that port by France. In September Abd-el-Aziz arrived at Rabat from Fez to seek the support of the European powers against his brother. From France he was later enabled to negotiate a loan. His leaning to Christians aroused further opposition and in January 1908 he was declared deposed by the ulema of Fez, who offered the throne to Hafid. After months of inactivity Abd-el-Aziz made an effort to restore his authority, and quitting Rabat in July he marched on Marrakesh. His force was completely overthrown (Aug. 19) when near that city, and Abd-el-Aziz fled to Settat within the French lines round Casablanca. In November he came to terms with his brother, and thereafter took up his residence in Tangier as a pensioner of the new sultan. (*See* MOROCCO: *History.*)

**ABD-EL-KADER** (1807?–1883), amir of Mascara, the great opponent of the conquest of Algeria by France, was born near Mascara in 1807 or 1808. His family were *sherifs* or descendants of Mohammed, and his father, Mahi-ed-Din, was celebrated throughout north Africa for his piety and charity. Abd-el-Kader received an excellent education in theology and philosophy, in horsemanship and in other manly exercises. A pilgrimage to Mecca and Medina and to the tomb of Sidi Abd-el-Kader El Jalili at Baghdad stimulated his religious enthusiasm. While in Egypt in 1827, Abd-el-Kader was impressed by the reforms then being carried out by Mohammed Ali, and the knowledge he then gained affected his career. Mahi-ed-Din and his son returned to Mascara shortly before the French occupation of Algiers destroyed the government of the Dey (July 1830). Coming forward as the champion of Islam against the infidels, Abd-el-Kader was proclaimed amir at Mascara in 1832. In a short time he had rallied to his standard all the tribes of western Algeria. The story of his 15 years' struggle against the French is given under ALGERIA. Up to the beginning of 1842 the contest went in favour of the amir; thereafter he found in Marshal Bugeaud an opponent who proved, in the end, his master. Throughout this period Abd-el-Kader showed himself a born leader of men, a great soldier, a capable administrator, a persuasive orator, a chivalrous opponent. His ultimate failure was due in considerable measure to the refusal of the Kabyles, Berber mountain tribes whose Mohammedanism was somewhat loosely held, to make common cause with the Arabs against the French. On Dec. 21, 1847 Abd-el-Kader surrendered to General Lamoricière at Sidi Brahim. On the 23rd, his submission was formally made to the duc d'Aumale, then governor of Algeria. In violation of the promise that he would be allowed to go to Alexandria or St. Jean d'Acre, Abd-el-Kader and his family were detained in France, where he remained until Oct. 1852, when he was released by Napoleon III. on taking an oath never again to disturb Algeria. The amir then lived in Brusa, removing in 1855 to Damascus. In July 1860, when the Muslims attacked the Christian quarters of Damascus, Abd-el-Kader saved large numbers of Christians.

When the Algerians revolted, Abd-el-Kader, in 1871, counselled submission to France. After 1847 he composed a philosophical treatise, of which a French translation was published in 1858 under the title of *Rappel à l'intelligent, Avis à l'indifférent.* He also wrote a book about the Arab horse. He died at Damascus on May 26, 1883.

**ABDEL KRIM** (1881– ), Mohammed ben Abdel Krim el-Khatabe, a Moroccan chieftain, son of a caid of the Beni Uriaghel tribe in the mountainous country that extends inland from Alhucemas bay on the Rif coast of Morocco. His father was a person of no particular importance or family, but, being a man of progressive ideas and in contact with the Spaniards at Melilla, he gave his two sons an education to which few of the Riffian tribesmen aspire. While Mohammed, the future Riffian leader, was taught Spanish and a smattering of European knowledge, his brother, Mohammed, was sent to Spain and educated as a mining engineer. (It is customary among the peoples of northern Africa and Egypt to give brothers the same name if it is an illustrious one.) Abdel Krim was employed in the office of native affairs at Melilla, while his brother worked in the interests of certain mining groups.

In 1919 a quarrel between Abdel Krim and General Silvestre, of the Spanish army, led to the former's flight from Melilla. He took to the mountains of his tribe, where his brother joined him Both swore revenge, and instituted a fierce resistance to the occupation of the Rif by the Spaniards. In 1921 Abdel Krim avenged himself of the slight he had received from Silvestre. With only a few hundred tribesmen, he attacked the Spanish advanced post of Anual and captured it. Silvestre was killed, or committed suicide. The fall of Anual spread panic through the Spanish army of 19,000 men. The Spanish posts were deserted, and the troops fled in disorderly retreat. Before the fighting was ended 16,000 of the 19,000 men had been massacred. The remainder mostly crossed into the French zone. The Riffian tribesmen were guilty of every kind of treachery and atrocity, their revenge for acts of which they accused the Spaniards, more especially that of forcible interference with their women, an unpardonable offence in their eyes. The Rifi reached the walls of Melilla, and, had they chosen, they could have captured the town and massacred its population of 50,000 civilians. But glutted with bloodshed and loaded with loot, they desisted.

This signal defeat of the Spaniards vastly increased Abdel Krim's reputation amongst the tribes. The Jabala, inhabiting the western portion of the Spanish zone, joined his cause and in 1924 the Spaniards were obliged to abandon all their inland positions and retreat on Tetuan and the sea, suffering heavy losses in the retirement. By the end of that year Abdel Krim, having rid himself by capture of his only rival, Raisuli, was master of the situation, and set to work to prepare a fresh campaign against the Spaniards. But a new danger threatened him from the south. The French, gradually occupying the zone to which they laid claim under existing treaties, were advancing northward, and Abdel Krim was forced to go to the aid of the threatened tribes. His army and the revolted tribesmen invaded the French protectorate, and by June 1925 threatened Fez.

French reinforcements were hurriedly dispatched from France and Algeria, and by October the French protectorate territory was clear of the enemy, and a French army of 160,000 men, under Marshal Pétain, was on the borders of the Rif. In September the Spaniards had successfully disembarked a force in Alhucemas bay and Ajdir had been taken. By Nov. 1, 1925 the French and Spanish armies had been obliged by the weather to abandon an active campaign, and were digging themselves into winter quarters, but Abdel Krim, though weakened and threatened, was by no means beaten. This man of great ability and astounding energy fortified his mountain fastnesses and collected new forces to continue his campaign against two European armies, but in vain. He surrendered to France in May 1926, and was exiled to the island of Réunion. *See* MOROCCO: *History.*

(W. B. H.)

**ABDERA,** ancient town, coast of Thrace, near the mouth of the Nestos, almost opposite Thasos. Its mythical foundation was attributed to Heracles; historically it was a colony from Clazomenae in the 7th century B.C. But its prosperity dates from 544 B.C., when the majority of the people of Teos migrated to Abdera to escape Persian oppression (Herod. i. 168). The town seems to have declined in importance after the middle of the 4th

century. The air of Abdera was proverbial as causing stupidity; but among its citizens was the philosopher Democritus. The ruins on Cape Balastra cover seven small hills, and extend from an east to a west harbour; on the south-west hills are remains of the mediaeval settlement of Polystylon.

See *Mittheil d. deutsch Inst Athens*, xii (1887), p 161 (Regel), *Mém. de l'Acad des Inscriptions* xxxiv 211, K F Hermann, *Ges Abh.* 90–111, 370 ff ; S Casson, *Macedon. Thrace and Illyria* (1926), Pauly-Wissowa, *s v.*

ABDERA, an ancient seaport on the south coast of Spain, between Malaga and New Carthage, in the district inhabited by the Bastuli Founded by the Carthaginians, it became an important town in the Roman province of Hispania Baetica. It was on a hill above the modern Adra (*q.v.*). Its most ancient coins bear the Phoenician inscription, *abdrt*, with the head of Heracles (Melkarth) and a tunny-fish; those of Tiberius (who seems to have made the place a colony) show the chief temple of the town with two tunny-fish erect in the form of columns.

ABDICATION, the act whereby a person in office renounces the same before the expiry of the time for which it is held. (Lat *abdicatio*, from *ab*, from, and *dicare*, to proclaim as not belonging to one) In Roman law, the term is especially applied to the disowning of a member of a family, as the disinheriting of a son, but the word is seldom used except in the sense of surrendering the supreme power in a State. Despotic sovereigns are at liberty to divest themselves of their powers at any time, but it is otherwise with a limited monarchy. The throne of Great Britain cannot be lawfully abdicated unless with the consent of the two houses of parliament. When James II fled in 1688, the question was discussed in parliament whether he had forfeited the throne or had abdicated. Later abdications include:

Pu-yi (China) Feb. 12, 1912; Nicholas II (Russia) March 15, 1917, Ferdinand I (Bulgaria) Oct. 3, 1918, William II (Germany) Nov 9, 1918; Frederick Augustus III (Saxony) Nov. 9, 1918, Charles I (Austria-Hungary) Nov. 12, 1918; Louis III (Bavaria) Nov 13, 1918, Frederick II (Baden) Nov. 22, 1918; William II (Wurttemberg) Dec. 2, 1918; George II (Greece) Dec. 18, 1923, but restored to the throne Nov. 1935; Edward VIII (Great Britain) Dec. 11, 1936; Carol II (Rumania) Sept 6 1940; Mihai (Michael) I (Rumania) Dec 30, 1947, Wilhelmina (Netherlands) Sept. 4, 1948.

ABDOMEN, the belly, the body cavity lying between the chest or thorax above and the pelvis below. The diaphragm is its upper boundary. There is no wall or clear-cut boundary between it and the pelvis. It contains organs of digestion and the spleen which are surrounded by the peritoneum which is a serous membrane. (*See* ANATOMY; ALIMENTARY CANAL.)

**ABDOMEN, SURGERY OF.** The diseases of this region are dealt with generally in the article ALIMENTARY SYSTEM, DISEASES OF THE, and under their own names (*e.g.*, APPENDICITIS). For the surgery of each abdominal organ *see* STOMACH; KIDNEY, DISEASES OF; LIVER AND GALL-BLADDER, DISEASES OF, etc.

**Exploratory Laparotomy.**—In many cases of intra-abdominal disease the surgeon cannot say what is wrong without making an incision and examining by sight or touch. Under conditions of strict asepsis this is not a perilous or serious procedure. When an opening is made in such circumstances—provided only it is done soon enough—the successful treatment of the case often becomes a simple matter.

A great impetus was given to the surgery of wounded, mortified, or diseased pieces of intestine by the introduction from Chicago of a contrivance named, after the inventor, *Murphy's button*. This consists of a short nickel-plated tube in two pieces, which are secured in the divided ends of the bowel so that when the pieces are subsequently "married" the adjusted ends of the bowel are securely fixed together and the canal rendered practicable. In the course of time the button loosens itself into the interior of the bowel and comes away with the motions. In many other types of case the button has proved convenient and successful, but sometimes ulceration occurs around the rim of the metal button, or the loosened metal causes trouble in its passage along the alimentary canal. Some surgeons therefore prefer a bobbin of decalcified bone or similar soft material, while others rely upon direct suturing of the parts. The last-named method has increased in favour The cause of death in intestinal obstruction is usually absorption of poisonous substances formed in the bowel above the obstruction. Usually, therefore, the surgeon completes his operation for the relief of obstruction by drawing out a loop of the distended bowel, incising and evacuating it, and then carefully suturing and returning it.

Rectal or subcutaneous injections of saline or other fluid and early adoption of a sitting position for the patient are other measures often adopted.

**Wounds of the Abdomen.**—The treatment of gunshot wounds of the abdomen differs according to circumstances. If the wound be caused by a rifle bullet travelling at high speed, the intra-abdominal pressure is usually sufficient to prevent escape of intestinal contents; complete rest and avoidance of surgery is the procedure of choice, and the chance of recovery is great though several coils of intestine may have been pierced But if the wound be caused by a fragment of high explosive shell, or a revolver shot or a stab this is not the case To avoid the onset of peritonitis, early operation, suture of the wounded gut and washing out of the peritoneal cavity afford the only chance for the patient. The "expectant" treatment which proved best in the South African War (1899–1902) was at first followed in the World War, but soon was abandoned in favour of laparotomy.

**Intussusception.**—This is a terribly fatal disease of infants and children, in which a piece of bowel slips into, and is gripped by, the piece next below it. Formerly attempts were made to reduce the invagination by passing air or water up the rectum under pressure, but now early recourse is had to abdominal surgery with far better results

**Cancer of the Intestine.**—With the introduction of aseptic surgery the bowel can be reached through the peritoneum easily and safely. If the cancerous mass is fairly movable the affected piece of bowel is excised, the cut ends are united and the continuity of the alimentary canal is re-established. When the lowest part of the bowel was found to be cancerous, the surgeon used formerly to secure an escape for the contents of the bowel by making an opening into the colon in the left loin. But in recent years this operation of *lumbar colotomy* has been almost entirely replaced by opening the colon in the left groin.

ABDUCTION, a law term denoting the forcible or unlawful removal of a person. The Offences against the Person Act 1861, by s. 53, makes it felony for any one from motives of lucre to take away or detain against her will, with intent to marry or carnally know her, etc., any woman of any age who has any interest in any real or personal estate, or is an heiress presumptive, or co-heiress, or presumptive next of kin to any one having such an interest; or for any one to cause such a woman to be married or carnally known by any other person; or for any one with such intent to allure, take away, or detain any such woman under the age of 21, out of the possession and against the will of her parents or guardians. By s. 54, forcible taking away or detention against her will of any woman of any age with like intent is felony. The same act, by s. 55, makes abduction without even any such intent a misdemeanour, where an unmarried girl under the age of 16 is unlawfully taken out of the possession and against the will of her parents or guardians. The girl's consent is immaterial, nor is it a defence that the person charged reasonably believed that the girl was 16 or over. By s. 56, stealing a child under the age of 14 with intent to deprive parents or guardian of such child is also a felony. The Criminal Law Amendment Act 1885 made still more stringent provisions with reference to abduction by making the procuration or attempted procuration of any virtuous female under the age of *twenty-one years* a misdemeanour, as well as the abduction of any girl under *eighteen years* of age with the intent that she shall be carnally known, or the detaining of *any female* against her will on any premises, with intent to have, or that another person may have, carnal knowledge of her.

In the United States, in some of the States, mere unchastity is no defence. The burden of proof is on the defendant that the woman abducted was unchaste, the presumption of her chastity standing unless otherwise proved.

**ABDUL AZIZ** (ahbd-o͝ol ah-zēz) (1830–1876), sultan of Turkey, second son of Sultan Mahmud II, was born Feb 9, 1830, and succeeded his brother Abdul-Mejid as sultan 1861. He took advantage of the constant issue of state loans to acquire wealth which was squandered extravagantly, and received large sums from Ismail Pasha, the khedive of Egypt, for signing the firman of 1866, which made succession to the khedivate hereditary from father to son in direct line, as well as subsequent firmans of 1867, 1869 and 1872, extending the khedive's prerogatives. In 1870 Abdul Aziz signed the firman creating the Bulgarian exarchate, thus separating the Bulgarian church from the Greek church at Constantinople. The insurrection of 1875 in Bosnia and Hercegovina and the abortive revolts in Bulgaria (Sept. 1875 and May 1876) together with the sultan's incapacity and extravagance in Turkey itself caused an outbreak of Moslem discontent and fanaticism culminating in the Bulgarian atrocities, and in the murder of two consuls at Salonika. Abdul Aziz was deposed May 29, 1876, by a group of prominent politicians, and his death, four days later, is attributed to suicide.

Abdul Aziz was the first Ottoman sultan to visit western Europe (1867).

**ABDUL-HAMID I** (1725–1789), sultan of Turkey, son of Ahmed III, succeeded his brother Mustafa III in 1773, and died on April 7, 1789. For the disastrous wars with Russia which marked his reign *see* TURKEY.

**ABDUL-HAMID II** (1842–1918), sultan of Turkey, son of Sultan Abdul-Mejid, was born on Sept. 21, 1842, and succeeded to the throne on the deposition of his brother, Murad V, on Aug. 31, 1876. He was brought to power by the group of liberals, led by Midhat Pasha, that had deposed his predecessor; and he inaugurated his reign by proclaiming a constitution. The first Ottoman parliament met on Dec. 23, 1876, the very day that the conference of the great powers in Constantinople began its deliberations. But the circumstances of the country at his accession were ill-adapted for liberal developments.

An empty treasury, the revolts in Serbia and Montenegro, the feeling aroused throughout Europe by the savage methods adopted in stamping out the Bulgarian rebellion, all combined to prove to the new sultan that he could expect little aid from the powers. But he obstinately opposed the pressing requests of the powers that the necessary reforms should be instituted. In 1878 the constitution was suspended. The exile in 1880 and the death in 1884 of Midhat followed, and a dictatorship was established which lasted until 1908.

Early in 1877 the disastrous war with Russia began. The hard terms, embodied in the treaty of San Stefano, to which Abdul-Hamid was forced to consent, were to some extent amended at Berlin, thanks in the main to British diplomacy (*see* EUROPE: *History*); but by this time the sultan had lost all confidence in England and thought that he discerned in Germany the future friend of Turkey. He employed Germans to reorganize his finances and army and determined to suppress all liberal tendencies and gradually to take the reins of absolute power into his own hands. Financial embarrassments forced him to consent to foreign control over the debt and to issue the decree of Dec. 1881, under which many of the revenues of the empire were handed over to the public debt administration for the benefit of the bondholders. Trouble in Egypt, where a discredited khedive had to be deposed, and trouble on the Greek frontier and in Montenegro, where the powers were determined that the decisions of the Berlin congress should be carried into effect, were more or less satisfactorily overcome. In his attitude toward Arabi, the would-be saviour of Egypt, Abdul-Hamid showed less than his usual astuteness, and the resulting consolidation of England's hold over the country contributed still further to his estrangement from Turkey's old ally. In 1881 the French occupied Tunisia. The union in 1885 of Bulgaria with Eastern Rumelia was another blow.

For several years the sultan preserved toward Bulgaria an attitude skilfully calculated to avoid running counter either to Russian or to German wishes. Germany's friendship was not entirely disinterested and had to be fostered with a railway or loan concession from time to time, until in 1899 the Baghdad railway was conceded.

Meanwhile the sultan had succeeded in reducing his ministers to the position of secretaries and in concentrating the whole administration of the country into his own hands at Yildiz But internal dissension was not thereby lessened. Crete was constantly in turmoil, the Greeks were dissatisfied, and from about 1890 the Armenians began a violent agitation with a view to obtaining the reforms promised them at Berlin. Minor troubles had occurred in 1892 and 1893 at Marsovan and Tokat. In 1894 a more serious rebellion in the mountainous region of Sassun was ruthlessly stamped out. The powers insistently demanded reforms, the eventual grant of which in the autumn of 1895 was the signal for a series of massacres in the Armenian provinces and in Constantinople itself.

The reforms became more or less a dead letter. Crete indeed profited by the grant of extended privileges, but these did not satisfy its turbulent population, and early in 1897 a Greek expedition sailed to unite the island to Greece. War followed, in which Turkey was easily successful and gained a small rectification of frontier; then a few months later Crete was taken over *en dépôt* by the Four Powers (Germany and Austria not participating) and Prince George of Greece was appointed their mandatory. In the next year the sultan received the visit of the German emperor and empress.

Abdul-Hamid had always resisted the pressure of the European powers to the last moment, in order to seem to yield only to overwhelming force, while posing as the champion of Islam against aggressive Christendom. Pan-Islamic propaganda was encouraged; the privileges of foreigners in the Ottoman empire (often an obstacle to government) were curtailed; the new railway to the Holy Places was pressed on, and emissaries were sent to distant countries preaching Islam and the caliph's supremacy. This appeal to Moslem sentiment was, however, powerless against the disaffection due to perennial misgovernment.

In Mesopotamia and Yemen disturbance was endemic; nearer home, a semblance of loyalty was maintained in the army and among the Moslem population by a system of delation and espionage and by wholesale arrests; while, obsessed by terror of assassination, the sultan withdrew himself into fortified seclusion in the palace of Yildiz.

**Macedonian Crisis.**—The humiliation of the situation in Macedonia (*q.v.*), together with the resentment in the army against the palace spies, brought matters to a crisis. The remarkable revolution associated with the names of Niazi Bey and Enver Bey, the Young Turk leaders, and the Committee of Union and Progress is described elsewhere (*see* TURKEY: *History*); here it must suffice to say that Abdul-Hamid, on learning of the threat of the Salonika troops to march on Constantinople (July 22), at once capitulated. On July 24 an *iradé* announced the restoration of the suspended constitution of 1876 and a Young Turk government was formed; next day, further *iradés* abolished espionage and the censorship and ordered the release of political prisoners. On Dec. 10 the sultan opened the Turkish parliament with a speech from the throne in which he said that the first parliament had been "temporarily dissolved until the education of the people had been brought to a sufficiently high level by the extension of instruction throughout the empire."

The correct attitude of the sultan did not save him from the suspicion of intriguing with the powerful reactionary elements in the state, a suspicion confirmed by his attitude toward the counter revolution of April 13, when an insurrection of the soldiers and the Moslem populace of the capital overthrew the committee and the ministry. The committee, restored by the Salonika troops, now decided on Abdul-Hamid's deposition, and on April 27 his brother Reshid Effendi was proclaimed sultan as Mohammed V. The former sultan was confined at Salonika.

When Salonika capitulated to the Greeks in the Balkan War (1912) Abdul-Hamid was brought back to Constantinople. In 1915 he was removed to Magnesia, in Asia Minor, where he died on Feb. 10, 1918.

*See* Sir E. Pears, *Life of Abdul-Hamid* (London, 1917); C. Hacquard, *La Turquie sous Abdul-Hamid II* (Brussels, 1901).

**ABDULINO,** town in the Chkalov region of the Russian S.F.S.R. Pop. 13,690. It is on the boundary between Kuibyshev and Bashkiria on the Uk river, north of the railway from Kuibyshev to Ufa, and is a market for local products.

**ABDUL MEJID** (ahbd-ōōl mĕ-jēd′) (1823–1861), sultan of Turkey, was born April 23, 1823, and succeeded his father, Mahmud II., on July 2, 1839. Mahmud appears to have been unable to effect the reforms he desired in the mode of educating his children, so that his son received no better education than that usually given to Turkish princes in the harem. Abdul Mejid succeeded to the throne at a moment of crisis. The news was on its way to Constantinople that the Turkish army had been defeated at Nezib by that of the rebel Egyptian viceroy, Mohammed Ali; and the Turkish fleet was on its way to Alexandria, where it was handed over by its commander, Ahmed Pasha, to the enemy, on the pretext that the young sultan's advisers were sold to Russia. Through the intervention of the European Powers Mohammed Ali was obliged to come to terms, and the Ottoman Empire was saved. *See* MOHAMMED ALI.

Abdul Mejid set at once about carrying out the reforms to which Mahmud had devoted himself. In Nov. 1839 was proclaimed an edict, known as the Tanzimāt, or Hatt-i-sherif of Gulhané, consolidating and enforcing these reforms; this was supplemented at the close of the Crimean War by a similar statute issued in Feb. 1856. These enactments provided that all classes of the sultan's subjects should have security for their lives and property; that taxes should be fairly imposed and justice impartially administered; and that all should have full religious liberty and equal civil rights. The scheme was opposed by the governing classes and the *ulema,* or privileged religious teachers, and was but partially put in force, especially in the remoter parts of the empire; and more than one conspiracy was formed against the sultan's life on account of it.

Of the other measures of reform promoted by Abdul Mejid the more important were: the institution of a council of public instruction (1838), the reorganization of the army (1843–44), and of a ministry of public instruction (1857), the abolition of an odious and unfairly imposed capitation tax, the repression of slave trading, and various provisions for the better administration of the public service and for the advancement of commerce, including the establishment of a mixed commercial court at Constantinople. For the general history of his times—the disturbances and insurrections in different parts of his dominions throughout his reign, and the great war successfully carried on against Russia by Turkey, and by Britain, France and Sardinia, in the interest of Turkey (1853–56)—*see* TURKEY and CRIMEAN WAR. When Kossuth and others sought refuge in Turkey, after the failure of the Hungarian rising in 1849, the sultan refused to surrender them. It is to his credit, too, that he would not allow the conspirators against his own life to be put to death. He was described as a kind and honourable man, if somewhat weak and easily led.

His extravagance, especially towards the end of his life, was excessive. He died on June 25, 1861, and was succeeded by his brother, Abdul Aziz (*q.v.*), as the oldest survivor of the family of Osman. He left several sons, of whom two, Murad V. and Abdul Hamid II., eventually succeeded to the throne.

**ABDUR RAHMAN KHAN** (*c.* 1844–1901), amir of Afghanistan, was the son of Afzul Khan, eldest son of the amir Dost Mohammed Khan (*q.v.*). Before his death in 1863, Dost Mohammed had nominated as his successor Sher Ali, his third son, passing over the two elder brothers, Afzul Khan and Azim Khan; and at first the new amir was quietly recognized. But after a few months Afzul Khan raised an insurrection in the northern province, between the Hindu Kush mountains and the Oxus, where he had been governing when his father died; and then began a fierce contest for power among the sons of Dost Mohammed which lasted for nearly five years. In this war Abdur Rahman soon became distinguished for ability and daring energy. Although his father, Afzul Khan, who had none of these qualities, came to terms with the amir Sher Ali, the son's behaviour in the northern province soon excited the amir's suspicion, and Abdur Rahman, when he was summoned to Kabul, fled across the Oxus into Bukhara. Sher Ali threw Afzul Khan into prison, and a serious revolt followed in south Afghanistan; but the amir had scarcely suppressed it when Abdur Rahman's reappearance in the north was a signal for a mutiny of the troops stationed in those parts and a gathering of armed bands to his standard. After some delay and desultory fighting, he and his uncle Azim Khan occupied Kabul (Feb. 1866).

The amir Sher Ali marched against them from Kandahar; but in the battle that ensued at Sheikhabad on May 9, he was deserted by a large body of his troops and was defeated. Abdur Rahman then released his father, Afzul Khan, from prison in Ghazni and installed him as amir of Afghanistan.

Notwithstanding the new amir's incapacity and some jealousy between the real leaders, Abdur Rahman and his uncle, they again routed Sher Ali's forces and occupied Kandahar in 1867; and when at the end of that year Afzul Khan died, Azim Khan succeeded to the rulership, with Abdur Rahman as his governor in the northern province.

But toward the end of 1868 Sher Ali's return and a general rising in his favour, resulting in their defeat at Zurmat on Jan. 3, 1869, forced them both to seek refuge in Persia, from where Abdur Rahman proceeded afterward to place himself under Russian protection at Samarkand. Azim died in Persia in Oct. 1869. At the end of the second Afghan War, in 1880, Abdur Rahman was recognized by the British as amir of Kabul.

In 1893 the amir showed his usual ability in the settlement of the frontier question with Sir Mortimer Durand's mission. Abdur Rahman died on Oct. 1, 1901, being succeeded by his son Habibullah. (*See* AFGHANISTAN: *History.*)

BIBLIOGRAPHY.—S. Wheeler, *The Ameer Abdur Rahman* (London, 1895); J. A. Gray, *At the Court of the Amir,* 2nd ed. (London, 1901); Mir Munshi Sultan Mahomed Khan (ed.), *Life of Abdur Rahman, Amir of Afghanistan* (London, 1900).

**À BECKETT, GILBERT ABBOTT** (1811–1856), English humorous writer, was born in north London on Jan. 9, 1811. He belonged to a family claiming descent from the father of St. Thomas Becket. His elder brother, Sir William à Beckett (1806–1869), became chief justice of Victoria (Australia). Gilbert Abbott à Beckett was educated at Westminster School, was called to the bar at Gray's Inn in 1841, and in 1849 became a metropolitan police magistrate.

He edited *Figaro in London,* and was one of the original staff of *Punch* and a contributor all his life. He produced some 50 or 60 plays, among them dramatized versions of Dickens' shorter stories in collaboration with Mark Lemon. He died at Boulogne Aug. 30, 1856.

His eldest son, GILBERT ARTHUR À BECKETT (1837–1891) was born at Hammersmith on April 7, 1837. On leaving Christ Church, Oxford, he was entered at Lincoln's Inn, but gave his attention chiefly to the drama, producing *Diamonds and Hearts* at the Haymarket in 1867, which was followed by other light comedies.

His pieces include numerous burlesques and pantomimes, the libretti of *Savonarola* (Hamburg, 1884) and of *The Canterbury Pilgrims* (Drury Lane, 1884) for the music of Dr. (afterward Sir) C. V. Stanford. *The Happy Land* (Court Theatre, 1873), a political burlesque of W. S. Gilbert's *Wicked World,* was written in collaboration with F. L. Tomline. For the last ten years of his life he was on the regular staff of *Punch.* He died on Oct. 15, 1891.

A younger son, ARTHUR WILLIAM À BECKETT (1844–1909), a well-known journalist and a man of letters, was also on the staff of *Punch* from 1874–1902, and gave an account of his father and his own reminiscences in *The À Becketts of Punch* (1903). He died in London on Jan. 14, 1909.

*See* also M. H. Spielmann, *The History of Punch* (1895).

**ABEDNEGO,** the name given in Babylon to Azariah, one of the companions of Daniel (Dan. i. 7, etc.). Probably a corruption of Abednebo, "servant of Nebo," or perhaps of Abednergo for Abednergal, "servant of the god Nergal."

**ABEKEN, HEINRICH** (1809–1872), German theologian and Prussian official, was born at Berlin on Aug. 3, 1809. In 1848

he entered the Prussian ministry for foreign affairs and in 1853 was promoted to be privy councillor of legation (Geheimer Legationsrath). He was employed by Bismarck in the writing of official despatches and often accompanied King William on his journeys as representative of the foreign office and was with him during the campaigns of 1866 and 1870–71.

See *Heinrich Abeken, ein schlichtes Leben in bewegter Zeit* (1898), by his widow. English translation by Mrs. C. E. Barrett-Lennard and M. W. Hofer (with portraits 1911). This is valuable by reason of the letters written from the Prussian headquarters.

**ABEL** (Hebrew Hebel, *breath*), second son of Adam, slain by Cain, his elder brother (Gen. iv, 1–15). The narrative in Genesis is supplemented in the New Testament ("By faith Abel offered unto God a more excellent sacrifice than Cain," Heb. xi, 4; Cain slew Abel "because his own works were evil, and his brother's righteous," 1 John iii, 12). The name probably means "herdsman" (*cf.* Jabal), as distinguished from the agriculturist Cain Possibly Abel was originally a South Judaean demigod or hero; *see* Winckler, *Gesch. Israels,* ii, p. 189; E. Meyer, *Israeliten,* p. 395. Augustine (*De Haeresibus,* lxxxvii) mentions a sect of *Abelitae,* in northern Africa.

**ABEL, JOHN JACOB** (1857–1938), U.S. pharmacologist and physiological chemist, was born in Cleveland, O., on May 19, 1857. He began life as a teacher and in 1879–82 was a principal and superintendent of schools in Indiana. In 1883 he graduated from the University of Michigan and, after a year at Johns Hopkins university, he devoted six years (1884–90) to the study of chemistry and medicine at Berlin, Strasbourg, Vienna and other European universities. He was lecturer on materia-medica in the University of Michigan in 1890–91 and then entered the faculty of Johns Hopkins university where in 1893 he became professor of pharmacology and physiological chemistry. He made extensive investigations of the chemical composition of animal tissues and fluids and also of the function and isolation of special chemical principles of the animal organism. A noteworthy example of the latter was his isolation of the blood-pressure-raising constituent of [illegible] glands (epinephrine) in the form of a benzoyl [illegible] made researches also on carbamic acid, the action of phthaleins, the poisons of mushrooms, albumoses in the tissues, hydrolytic products of proteins, histamin, insulin and various related subjects, in connection with which he has published many important papers. Two of his contributions to medical science were the isolation of adrenalin and the isolation of insulin in crystal form.

**ABEL, KARL FRIEDRICH** (1725–87), German musician, was born in Cöthen and died in London, where he lived during the greater part of his career. He was a great player on the viola da gamba, composed much music for that instrument and was one of the most prominent figures in the London musical life of his day. He studied under Johann Sebastian Bach at the Leipzig Thomasschule; played for ten years (1748–58) under A. Hasse in the band formed at Dresden by the elector of Saxony; and then, going to England, became (in 1759) chamber-musician to Queen Charlotte. The friendship between Johann Christian Bach, 11th son of Sebastian, who had also settled in London, and Abel led, in 1764 or 1765, to the establishment, at first under the auspices of the notorious Mrs. Cornelys, of the famous concerts subsequently known as the Bach and Abel concerts. The Hanover Square rooms were opened, on Feb. 1, 1775, by one of these concerts, at which, too, Haydn's symphonies were first performed in England. He was a man of striking presence, as several fine portraits, including two by Gainsborough, attest.

**ABEL, NIELS HENRIK** (1802–1829), Norwegian mathematician, was born at Findoe on Aug. 5, 1802, and died at Froland. One of the major creators of modern mathematics, Abel gave 19th century algebra, analysis and logical rigour some of their strongest impulses. The second of seven children of an impecunious pastor, he grew up in such poverty that his constitution was weakened irreparably, and he died of tuberculosis in his 27th year. Through all his poverty and illness he retained his courage and geniality. Poor himself, he shared what little he earned with his widowed mother and brothers and sisters.

Abel discovered his extraordinary mathematical talent when he was about 15, and within a year was mastering the works of Isaac Newton, Leonhard Euler, Carl Gauss and Joseph Lagrange. Somewhat shocked by the naive formalism of Euler's infinite algorithms, he made it one of his main projects to remedy the logical defects in the analysis of his time. He thus became one of the first rigourists and one of the most influential. His was the first satisfactory proof, for example, of the general binomial theorem. His discussion of convergence opened a new era in analysis. Prompted by his teacher, B. M. Holmboë (who in 1839 edited the first edition of Abel's works), he attempted the algebraic solution of the general quintic, and believed he had succeeded. When he realized his mistake, he conceived the revolutionary idea of trying to prove the impossibility of an algebraic solution. He succeeded. This is one of the outstanding landmarks in the methodology of mathematics.

On the completion of his course at the University of Kristiania (Oslo) in June 1822, he was subsidized by the Norwegian government so that he might continue his researches. In Aug. 1825, his mathematical friends persuaded the government, then having severe financial difficulties of its own, to grant him sufficient funds for a year's travel and study in France and Germany. He had planned to call on Gauss, to whom he had sent a copy of his memoir on the quintic; but hearing that Gauss had tossed it aside with the exclamation, "Here is another of those monstrosities!", he revised his plans. While in Berlin, he had the good fortune to meet A. L. Crelle (*q.v.*), who urged him to proceed with his epoch-making creation of the theory of elliptic functions. Although Abel's mathematics was beyond Crelle's understanding, he sensed that he was dealing with a mathematician of the first rank, and published many of Abel's papers in the first volumes of his great *Journal.*

Distracted by the sociability of Berlin, Abel sought seclusion at Freiburg. There he organized his masterpiece, *Memoir on a General Property of a Very Extensive Class of Transcendental Functions.* This work is concerned with algebraic functions and their integrals; it started one of the most extensive departments of mathematical analysis of the 19th century, and was responsible for a vast development of algebraic geometry.

Late in July 1826, Abel went to Paris, where he was politely received. His masterpiece was presented to the Paris Academy of Sciences in Oct. 1826, where it was mislaid till 1841, when it was recovered after an enquiry by a representative of the Norwegian government and published. During the printing, the original manuscript was lost. The main result in the memoir, known as "Abel's theorem," was described as "only a marvellous exercise in the integral calculus." As such, it revealed mathematical genius of a new order. Adrien Legendre, who generously encouraged Abel, described the theorem (in the words of Horace) as *monumentum aere perennius.*

By May 1827, Abel was destitute. He returned to Kristiania, fatally ill. The professorship he had hoped to obtain at the university had been reluctantly taken by Holmboë at the insistence of the government. His last days were spent at Froland, in the house of an English family where his fiancée was governess. "I will fight for my life!" he shouted in his delirium. He died on April 6, 1829. Two days after his death, Crelle wrote to say that he had succeeded in getting Abel appointed to the professorship of mathematics in the University of Berlin. (E. T. B.)

**ABÉLARD, PETER** (1079–1142), scholastic philosopher, was born in Pallet (Palais), not far from Nantes, in 1079. He was the eldest son of a noble Breton house. He studied first under Roscelin, the extreme nominalist, and then went to the cathedral school of Notre Dame, whose master was William of Champeaux, the disciple of St. Anselm, and most advanced of realists. After a short time he overcame the master in discussion, and thus began a long duel that issued in the downfall of the philosophic theory of realism, till then dominant in the early middle ages.

When William procured his expulsion from Paris, he set up a school of his own at Melun, whence he removed to Corbeil, nearer

Paris, finally becoming master of the school of St. Geneviève. He next turned to theology and attended the lectures of Anselm at Laon. His triumph over the theologian was complete; the pupil was able to give lectures, without previous training or special study, which were more popular than those of the master Abélard was now at the height of his fame. In 1115 he was made canon and master of Notre Dame, whither the fame of his learning and his personal charm drew students from all countries. (Fulk of Deuil, *Ep. ad Abaelardum.*)

Few teachers ever held such sway as Abélard now did for a time; but a change in his fortunes was at hand. He fell in love with the beautiful and learned Héloise, niece of Canon Fulbert, and seduced her. After the birth of their son, they were secretly married, though Héloise appealed to Abélard not to sacrifice his independence and chances of advancement. When the marriage became known, Héloise retired to the convent of Argenteuil Fulbert, believing that Abélard planned to be rid of her, took a barbarous revenge, breaking into his chamber by night and perpetrating upon him the most brutal mutilation. Abélard, in despair, became a monk at St Denys, and Héloise took the veil.

After a year Abélard opened a school of theology at the priory of Maisoncelle (1120). His lectures were heard again by crowds of students, and all his old influence seemed to have returned, but old enmities were revived also. His adversaries fell foul of his rationalistic interpretation of the Trinitarian dogma. Charging him with the heresy of Sabellius in a provincial synod held at Soissons in 1121, they procured a condemnation of his teaching, made him burn his book and shut him up in the convent of St. Médard at Soissons. When he returned to St. Denys, another dispute arose. He cited Bede to prove that Dionysius the Areopagite had been bishop of Corinth and not, as the monks held, bishop of Athens. When this historical heresy led to the inevitable persecution, Abélard withdrew to a desert place near Nogent-sur-Seine and turned hermit. His retreat becoming known, students flocked to him from Paris, and in gratitude for the consolation they brought him, he consecrated the new oratory they built for him by the name of the Paraclete.

Upon the return of new dangers, or at least of fears, Abélard accepted an invitation to preside over the abbey of St. Gildas de Rhuys, in Lower Brittany. The abbey was poor, disorderly and depraved, yet for nearly ten years he endured it, and it was only under peril of violent death that he fled from his charge. Meanwhile he had been able, on the breaking up of Héloise's convent at Argenteuil, to establish her as head of a new religious house at the deserted Paraclete. After his flight from St. Gildas, he wrote, among other things, his famous *Historia Calamitatum,* and thus moved Héloïse to pen her three *Letters,* which have kept their place among the great love letters of the world. In 1136 he was lecturing on Mount St. Geneviève (when he was heard by John of Salisbury), but it was only for a brief space. As far back as the Paraclete days he had been the opponent of Bernard of Clairvaux, who upheld the principle of fervent and unhesitating faith, from which rational inquiry like his was sheer revolt, and Abélard now came into conflict with this uncompromising spirit. In 1141 a council met at Sens, before which Abélard, formally arraigned upon a number of heretical charges, was prepared to plead his cause; but when Bernard had opened the case, suddenly Abélard appealed to Rome. The stroke availed him nothing; for Bernard, who had power, notwithstanding, to get a condemnation passed at the council, did not rest till a second condemnation was procured at Rome in the following year. Meanwhile, on his way thither to urge his plea in person, Abélard had broken down at the abbey of Cluny; and there, an utterly fallen man, only not bereft of his intellectual force, he lingered but a few months. Removed for the relief of his sufferings to the priory of St. Marcel, near Chalon-sur-Saone, he died April 21, 1142. Héloïse died in 1164, and the two now lie in the well-known tomb in the cemetery of Père Lachaise in Paris.

Great as was the influence exerted by Abélard on the minds of his contemporaries and the course of mediaeval thought, he has been little known in modern times but for his relations with Héloïse. Indeed, it was not till 1836, when Cousin issued the collection entitled *Ouvrages inédits d'Abélard,* that his philosophical performance could be judged at first hand; of his strictly philosophical works only one, the ethical treatise *Scito te ipsum,* having been published earlier (1721). Cousin's collection, besides giving extracts from the theological work, *Sic et Non* (an assemblage of opposite opinions on doctrinal points, culled from the Fathers as a basis for discussion, the main interest in which lies in the fact that there is no attempt to reconcile the different opinions), includes the *Dialectica,* commentaries on logical works of Aristotle, Porphyry and Boethius, and a fragment, *De Generibus et Speciebus,* which, with the psychological treatise *De Intellectibus* (published apart by Cousin in *Fragmens Philosophiques,* vol. ii) is now considered upon internal evidence not to be by Abélard himself. A genuine work, the *Glossulae super Porphyrium,* from which Charles de Rémusat, in his classical monograph *Abélard* (1845), has given extracts, remains in manuscript.

The general importance of Abélard lies in his having fixed more decisively than anyone before him the scholastic manner of philosophizing, with its object of giving a formally rational expression to the received ecclesiastical doctrine. However his own particular interpretations may have been condemned, they were conceived in essentially the same spirit as the general scheme of thought afterwards elaborated in the 13th century with approval from the heads of the church. Through him was prepared the ascendancy of the philosophical authority of Aristotle, which became firmly established in the half-century after his death, when first the completed *Organon,* and gradually all the other works of the Greek thinker, came to be known in the schools; before his time it was rather upon the authority of Plato that the prevailing realism sought to lean. As regards his so-called conceptualism and his attitude to the question of universals, *see* SCHOLASTICISM.

Outside of his dialectic, it was in ethics that Abélard showed greatest activity of philosophical thought, laying very particular stress upon the subjective intention as determining, if not the moral character, at least the moral value, of human action. His thought in this direction, wherein he anticipated something of modern speculation, is the more remarkable because his scholastic successors hardly ventured to bring the principles and rules of conduct under pure philosophical discussion, even after the ethical inquiries of Aristotle became known to them.

BIBLIOGRAPHY.—Abélard's own works remain the best sources for his life, especially his *Historia Calamitatum,* an autobiography, and the correspondence with Héloise. Charles de Rémusat's *Abélard* (1845) remains an authority; it must be distinguished from his drama *Abélard* (1877). McCabe's life of Abélard is written closely from the sources. *See* also U. Chevalier, *Répertoire des sources hist. du moyen âge,* "Abailard," (bibl.), and H. Rashdall, *Universities of Europe in the Middle Ages* (Oxford, 1895). A new translation of the famous *Letters* of Héloise, by George Moore, appeared in 1926.

**ABELIN, JOHANN PHILIPP,** (d. *c.* 1635) German chronicler. He wrote numerous histories over the pseudonyms of Philipp Arlanibäus, Abeleus and Johann Ludwig Gottfried or Gotofredus. His best known work is the *Theatrum Europaeum,* a series of chronicles of the chief events in the history of the world down to 1619. He compiled the first two volumes. It was continued by various writers and grew to 21 volumes (Frankf. 1633–1738). The chief interest of the work is its illustration by the beautiful copperplate engravings of Matthäus Merian (1593–1650).

*See* G. Droysen, *Arlanibaeus, Godofredus, Abelinus* (1864); and notice in *Allgemeine Deutsche Biographie.*

**ABELL, SIR WESTCOTT STILE** (1877– ), naval engineer. He was professor of naval architecture at Liverpool university, 1910–14, and chief ship surveyor at Lloyd's Register of Shipping from 1914 to 1928, when he was appointed professor of naval architecture at Armstrong college, Newcastle-upon-Tyne. A member of various boards, including two committees of the Board of Trade, on the Internationalization of the Load Line of Ships in 1913, and on Shipping and Shipbuilding in 1916, he became technical adviser to Controller of Shipping in 1917 and was president of the Institute of Marine Engineers 1924–25. He was created K.B.E. in 1920. Writings include *The Ship and her Work.*

**ABEL OF BETH-MAACAH,** a city in Maacah, one of the genuinely "Israelite" cities (*see* 2 Sam. xx, 18). The question of the Aramaean and Edomite composition of Israel involves a consideration of the territories occupied in early times by the tribes and their progenitor (Deut. xxvi, 5). Abel and Dan were considered as definitely Israelite cities (see *The Cambridge Ancient History,* 1926, vol. ii, pp. 368–69).

**ABEL TEST,** the close-test process of determining the flash-point of petroleum, invented by Sir Frederick Abel and embodied in the British Petroleum Act of 1879. The test is employed to ascertain whether a sample of petroleum may be safely used at a given temperature.

The Abel apparatus simply raises the temperature of the sample under test until the resultant combination of oil vapour and air forms an explosive mixture and causes a flash. The minimum limit of flash-point under British law is 73°, and most civilized countries have provided a similar test of inflammability. (*See* PETROLEUM.)

**ABENCERRAGES,** a family or faction that is said to have held a prominent position in the Moorish kingdom of Granada in the 15th century. The name appears to have been derived from Yussuf-ben-Serragh, the head of the tribe in the time of Mohammed VII. It is familiar from the interesting romance of Ginés Perez de Hita, *Guerras civiles de Granada,* which celebrates the feuds of the Abencerrages and the rival family of the Zegris. The hall of the Abencerrages in the Alhambra takes its name from being the reputed scene of the massacre of the family.

**ABENDANA,** the name of two Jewish theologians. (1) JACOB (1630–95), rabbi (Hakham) of the Spanish Jews in London from 1680. (2) ISAAC (*c.* 1650–1710), his brother, teacher of Hebrew at Cambridge and afterwards at Oxford. He compiled a Jewish calendar and wrote *Discourses on the Ecclesiastical and Civil Policy of the Jews* (1706).

**ABENEZRA** (Ibn Ezra), whose full name was Abraham ben Meir Ibn Ezra (1092 or 1093–1167), Jewish poet and scholar, was a native of Toledo. He had already gained a reputation as a thinker and poet before he left Spain, some time before 1140, and began the travels in northern Africa, in England, France and Italy which extended over a quarter of a century. He translated the writings of Hayyūj, the father of modern Hebrew grammar, from Arabic into Hebrew, and himself wrote treatises on the subject, the most important of which are *Moznayim* ("the Scales"), written in 1140, and *Zahot* ("Correctness"), written in 1141. His writings include works on philosophy, astronomy and mathematics; but his fame is derived chiefly from his commentaries on the Scriptures. Ibn Ezra sought to establish the simple sense of the text, basing his interpretation on solid grammatical principles. The commentary on the Pentateuch was first printed at Naples in 1488; in this edition a second commentary on Exodus takes the place of the original one. The great editions of the Hebrew Bible contain other commentaries by Ibn Ezra on Isaiah, the Minor Prophets, Job and Daniel; and his name was attached to commentaries on Proverbs, Ezra and Nehemiah, which were really the work of Moses Kimhi.

The *Yōsōd Mēra* (1158), the best known of his writings on the philosophy of religion, explains the reasons for the biblical commandments.

BIBLIOGRAPHY.—Among the literature on Ibn Ezra may be especially mentioned: M. Friedländer, *Essays on the Writings of Ibn Ezra* (London, 1877); W. Bacher, *Abraham Ibn Ezra als Grammatiker* (Strasburg, 1882); M. Steinschneider, *Abraham Ibn Ezra,* in the *Zeitschrift fur Mathematik und Physik,* Band xxv. Supplement; D. Rosin. *Die Religionsphilosophie Abraham Ibn Ezra's* in vols. xlii and xliii of the *Monatschrift fur Geschichte und Wissenschaft des Judenthums;* his *Divan* was edited by T. Egers (Berlin, 1886), a collection of his poems, *Reime und Gedichte,* with translation and commentary, were published by D. Rosin in several annual reports of the Jewish theological seminary at Breslau (1885–94).

**ABENSBERG,** a town and spa of Germany, in Bavaria, on the Abens, a tributary of the Danube, 18 mi. S.W. of Regensburg. Pop. (1933) 2,392. Some Roman remains exist in the neighbourhood of the town, which was known to the Romans as Castra Abusina. Here Napoleon defeated the Austrians under the Archduke Louis and Gen. Hiller on April 20, 1809

**ABEOKUTA,** a town of British West Africa, the capital of the Egba division of the Yoruba people and of the province of Abeokuta, southern Nigeria. It is situated in 7° 8′ N., 3° 25′ E., on the Ogun river, 64 mi. north of Lagos by railway or 81 mi. by water. Population (1938 census) 69,502. Abeokuta is surrounded by mud walls 18 mi. in extent and lies in a beautiful and fertile country, the surface of which is broken by masses of gray granite. Besides the usual mud-built houses there are several buildings (including public offices) of modern design. Palm-oil, timber, yams and shea-butter are the chief articles of trade.

Abeokuta (a word meaning "under the rocks"), dating from 1825, owes its origin to incessant inroads of slave-hunters from Dahomey and Ibadan, which compelled the village populations to take refuge in this rocky stronghold, which became the capital of the Egba state, the ruling chief being styled *Alake* (Ake is the principal quarter of Abeokuta and is the name of the ancient Egba capital). The Egba carried on a long war with Ibadan and claimed the right to close the trade routes to Lagos. This brought them from 1865 onward into collision with the British, but in 1893 a treaty was signed which, while preserving Egba independence in internal affairs, brought the state under direct British influence. Christian missions had been in Abeokuta since 1843 and gained many converts; in 1867 the Christians were expelled. They returned some years later and now form an influential part of the population. The town is the headquarters of the Yoruba branch of the Church Missionary society.

After 1899 when the railway from Lagos reached Abeokuta there was a large increase in trade. Meanwhile the Egbas had set up a government based on European models, and in 1904 the *Alake* created some interest in his country by a visit to England. But side by side with an administration on modern lines (including fiscal barriers) "there existed," to quote Sir F. D. Lugard, "the ancient *régime* with all its abuses—extortionate demands from the peasantry, corruption and bribery in the courts, arbitrary imprisonment and forced labour." These conditions could not be tolerated and in 1914 by a new agreement the Egbas renounced "independence," and their country, with Jebu and other districts, was constituted the province of Abeokuta. Since then the *Alake* and his council have carried on the native administration under the supervision of a British resident. In 1917 a somewhat serious rising occurred in the province; it was the only instance of the peace being disturbed in Nigeria during World War I.

*See* Sir F. D. Lugard's *Report on Nigeria* (pub. in 1920) as a White Paper (cmd. 468); an article on Abeokuta by Sir Wm. Macgregor, *African Society's Journal* No. xii (July, 1904); and Sir W. N. Geary, *Nigeria under British Rule* (1927).

**ABERAVON:** *see* PORT TALBOT.

**ABERCARN,** urban district, Monmouthshire, England. Pop. (est. 1938) 18,510. Area, 14.91 sq.mi. It is situated in the middle portion of the Ebbw valley and like the other towns of the north and east of the coal field had an early association with iron smelting and then relied more and more on the export of coal, but tin plates are manufactured in large quantities. Like the other towns of the coal field, it is mainly a long street along the valley. It shared the deep industrial depression in the neighbourhood in the 1930s. Abercarn has a station on the Great Western railway branch line from Newport and is in the Abertillery parliamentary division.

**ABERCORN, JAMES HAMILTON,** 1ST EARL OF (*c.* 1575–1618), was the eldest son of Claud Hamilton, Lord Paisley (4th son of James, 2nd Earl of Arran, and Duke of Chatelherault), and of Margaret, daughter of George, 6th Lord Seton. He was made sheriff of Linlithgow in 1600, received large grants of lands in Scotland and Ireland, was created in 1603 Baron of Abercorn and on July 10, 1606, was rewarded for his services in the matter of the union by being made Earl of Abercorn and Baron Hamilton, Mount Castle and Kilpatrick. He married Marion, daughter of Thomas, 5th Lord Boyd, and left five sons, of whom the eldest, Baron of Strabane, succeeded him as 2nd Earl of Abercorn. He died on March 23, 1618. The title of Abercorn, held by the head of the Hamilton family, became a marquisate in 1790 and a dukedom in 1868.

ABERCORN, JAMES HAMILTON, 2ND DUKE OF (1838–1913) British politician, born on Aug. 24, 1838, succeeded his father, the 1st Duke, in 1885. His sister, the Duchess of Buccleuch, was for many years mistress of the robes to Queen Victoria and to Queen Alexandra. The duke became a member of the household of the Prince of Wales (afterwards Edward VII.). He was a strong supporter of the Unionist Party in the House of Lords, and was chairman of the British South Africa Company. He died in London on Jan. 3, 1913.

ABERCORN, JAMES ALBERT EDWARD HAMILTON, 3RD DUKE OF (1869– ), British politician, son of the preceding, was born on Nov. 1, 1869, and was educated at Eton. Lord James Hamilton was M.P. for Londonderry, 1900–13, a leader of the Unionist Party in Ulster, and treasurer of H.M. Household in 1903–05. After the passage of the Government of Ireland Act, he became a senator of Northern Ireland, and in 1922 was appointed governor.

ABERCROMBIE, LASCELLES (1881–1938), English poet, was born at Ashton-under-Lyne, Cheshire, Jan. 9, 1881, and educated at Malvern and Victoria university, Manchester, where he studied science. His first work, *Interludes and Poems*, appeared in 1908. Other works are: *Mary and the Bramble* (1910); *Emblems of Love* (1912); *Deborah* (1912); *Speculative Dialogues* (1913); and *Collected Poems* (Oxford Poets, 1930). He was lecturer in poetry, Liverpool university, 1919–22; professor of English literature at Leeds university, 1922–29, and at London university 1929–35; and Goldsmith Reader in English at Oxford, 1935–38. To his students he emphasized the essential greatness of the writers he dealt with, rather than cumbersome details. His critical study of *Thomas Hardy* (1912), the *Theory of Poetry* (1924), his volume of collected lectures, *The Idea of Great Poetry* (1925), and *Liberty of Interpreting* (1930), and *Poetry—Its Music and Meaning* (1932), are important contributions to modern critical literature. His works include some plays in blank verse, among them *Phoenix* (1923).

**ABERCROMBY, DAVID,** a 17th century Scottish physician. His *Nova medicinae praxis* was reprinted after his death in Paris (1740). His *Tuta ac efficax luis venereae saepe absque mercurio ac semper absque salivatione mercuriali curando methodus* (1684) was translated into French, Dutch and German. In his *Discourse on Wit* (1685) he expounds the Scottish philosophy of common sense. The exact date of his death is unknown, but according to Haller he was alive early in the 18th century.

**ABERCROMBY, PATRICK** (1656–*c.* 1716), Scottish physician and author, was born at Forfar, and educated at St. Andrews. He is best known as the author of the *Martial Atchievements of the Scots Nation* (fol. 1711–16), in which he had the assistance of many learned contemporaries. As a pamphleteer on behalf of the Union he crossed swords with Daniel Defoe.

**ABERCROMBY, SIR RALPH** (1734–1801), British soldier, eldest son of George Abercromby, of Tullibody, Clackmannanshire, was born Oct. 7, 1734. Educated at Rugby and at Edinburgh University, he was sent in 1754 to Leipzig to study civil law, with a view to his proceeding to the Scottish bar. But he received a commission in the 3rd Dragoon Guards in March 1756. He served with his regiment in the Seven Years' War, and study of the methods of the great Frederick moulded his military character and formed his tactical ideas. In 1781 he became colonel of the King's Irish infantry. When that regiment was disbanded in 1783, he retired upon half pay. Hitherto he had scarcely been engaged in active service, mainly because of his disapproval of the policy of the Government, and especially because of his sympathies with the American colonists in their struggles for independence; and his retirement was no doubt the result of similar feelings. But on the declaration of war by France against England in 1793, he returned to the Army, and was appointed to the command of a brigade under the Duke of York, for service in Holland. He commanded the advanced guard in the action at Le Cateau, and was wounded at Nijmwegen. The duty fell to him of protecting the British Army in its disastrous retreat out of Holland in the winter of 1794–95. In 1795 he received a knighthood of the Bath, and in the same year he was appointed to succeed Sir Charles Grey as commander-in-chief of the British forces in the West Indies. In 1796 he seized Grenada, and then took the settlements of Demerara and Essequibo, and the islands of St Lucia, St Vincent and Trinidad. He held, in 1797–98, the chief command of the forces in Ireland. He sought to restore the discipline of the army, and declined to allow the military to be called out, except when it was indispensable for the maintenance of order. Finding that all his efforts were thwarted by the Government in Ireland, he resigned the command. After acting as commander-in-chief in Scotland, Sir Ralph was second-in-command to the Duke of York in the second disastrous expedition to Holland in 1797. In 1801 he was sent with an Army to turn the French out of Egypt. The disembarkation on March 2 of the troops at Aboukir Bay, in the face of strenuous opposition, is justly ranked among the most daring and brilliant exploits of the British Army. The French made a surprise attack on the British camp near Alexandria (March 21, 1801), and Abercromby fell in the moment of victory. He was struck by a spent ball, which could not be extracted, and died on board the flagship seven days after the battle. By a vote of the House of Commons, a monument was erected in his honour in St Paul's Cathedral. His widow was created Baroness Abercromby of Tullibody and Aboukir Bay, and a pension of £2,000 a year was settled on her and her two successors in the title.

A memoir of the later years of his life (1793–1801) by his third son, James (who was Speaker of the House of Commons, 1835–39, and became Lord Dunfermline), was published in 1861. For a shorter account of Sir Ralph Abercromby . . . . . *Twelve British Soldiers* (London, 1899).

**ABERDARE, HENRY AUSTIN BRUCE, 1ST BARON** (1815–95), English statesman, was born at Duffryn, Aberdare, Glamorganshire, on April 16, 1815. He was called to the bar in 1837, and was stipendiary magistrate for Merthyr Tydvil and Aberdare, 1847–52. The discovery of coal in the Duffryn and Aberdare estates of the family made him a rich man. He sat in the House of Commons for Merthyr Tydvil from 1852–68 and for Renfrewshire from 1869–73, when he became a peer. He was under-secretary at the Home Office (1862–64), vice-president of the board of education (1864–66), home secretary (1868–73), and lord president of the council (1873–74). After the defeat of the Liberal Government in 1874 Lord Aberdare turned to social and economic questions. From 1882, when he became chairman of the National African Company incorporated under charter in 1886 as the Royal Niger Company, he was closely associated with West African affairs. He presided over several royal commissions, and promoted university education in Wales. He died in London on Feb. 25, 1895.

**ABERDARE,** industrial town and urban district of Glamorganshire, Wales, at the confluence of the Dar and Cynon (the latter being a tributary of the Taff). Pop. (est. 1938) 43,030. Area, 25 sq.mi. The neighbouring moorlands show evidences of occupation in pre-Roman times, and a site about 4 mi. to the north-west of the town is reputed to be the scene of a Norman victory over the native forces under Rhys ap Tewdwr in the 11th century. Aberdare remained but a small nucleus among the scattered farms of the moorlands until the beginning of the 19th century when the place grew rapidly owing to the abundance of its coal and iron ore, and the population of the whole parish (which was only 1,486 in 1801) increased tenfold during the first half of the century. Ironworks were established at Llwydcoed and Abernant in 1799 and 1800 respectively, followed by others at Gadlys and Aberaman in 1827 and 1847. The building of the Glamorgan canal in 1811 connected these ironworks with the coast, but the rapid development of the railways superseded the canals and at the same time gave an impetus to the iron trade between 1820 and 1870 and a consequent rapid growth of the town. These ironworks have not been worked since 1875, and the only supplementary industry remaining in the town is a small tinplate works at Gadlys (established in 1868). Previous to 1836, most of the coal worked in the parish was consumed locally, chiefly in the ironworks, but in that year the working of steam coal for export was begun, pits were sunk in rapid succession, and the coal trade, which at

least since 1875 has been the chief support of the town, soon reached huge dimensions. There are several brickworks and breweries. This town was severely affected by the depression of the 1930s, 37.1% of the insured population being unemployed in May 1934. Until 1918 Aberdare was included for parliamentary representation with the borough of Merthyr Tydfil, but since then it returns a member jointly with the urban district of Mountain Ash.

**ABERDEEN, GEORGE GORDON, 1ST EARL OF** (1637–1720), lord chancellor of Scotland, was the son of Sir George Gordon of Haddo, who had been executed by the Presbyterians in 1664. He was born Oct. 3, 1637, and studied at Aberdeen and abroad. He was called to the bar in 1668 and gained a great reputation as a lawyer. He was president of the court of session in 1681 and lord chancellor of Scotland from 1682 to 1684. He was created earl of Aberdeen in 1682.

Burnet reflects unfavourably upon him, calls him "a proud and covetous man," and declares "the new chancellor exceeded all that had gone before him." He executed the laws enforcing religious conformity with severity, and filled the parish churches, but resisted the excessive measures of tyranny prescribed by the English government; and in consequence of an intrigue of the Duke of Queensberry and Lord Perth, who gained the duchess of Portsmouth with a present of £27,000, he was dismissed in 1684. He remained a non-juror during the whole of William's reign, and took the oaths for the first time after Anne's accession, on May 11, 1703. In the affair of the Union in 1707, he protested against the completion of the treaty till the act declaring the Scots aliens should be repealed, but refused to support the opposition to the measure itself. He died on April 20, 1720.

**ABERDEEN, GEORGE GORDON,** 4TH EARL OF (1784–1860), British statesman, was born in Edinburgh on Jan. 28, 1784, the son of George Gordon, Lord Haddo. At the age of 11, when he was left an orphan, he went to reside with Henry Dundas, afterwards Lord Melville; and three years later he was permitted by Scots law to select William Pitt and Dundas as his curators, or guardians. At Harrow and at St. John's college, Cambridge, he proved himself a gifted classical scholar, though modern history shared his interest; and his education was completed by an extended tour of Europe which took him to the Far East. On the death of his grandfather in 1801 he succeeded to the peerage, and four years later he married Catherine Hamilton, daughter of Lord Abercorn.

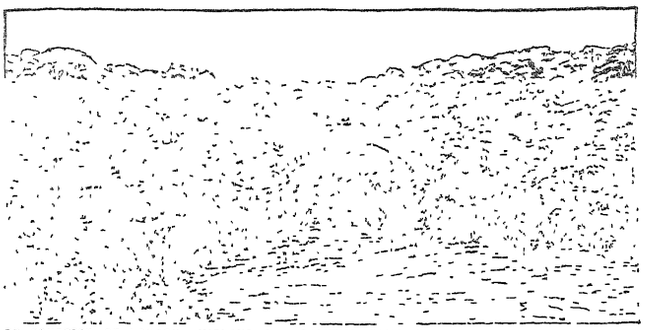
His connection with Pitt and Dundas, and his native ability, favoured him for a political career, and in 1812 he travelled as ambassador extraordinary to Austria, where he signed the Treaty of Töplitz in 1813. He remained on the Continent as one of the most active British representatives throughout the negotiations which led to the Treaty of Paris; then he returned to England, and for some years lived in comparative retirement. The year 1815 saw his marriage to Harriet, Lady Hamilton, his first wife having died three years before.

In Jan. 1828 he joined the cabinet of the duke of Wellington, and in the following June he became secretary of state for foreign affairs. Resigning in 1830 with Wellington, he did not again take office until the short administration of 1834 and 1835, when he was colonial secretary to Sir Robert Peel; but in 1841 he joined the latter's cabinet as foreign secretary and commenced the most fruitful and successful period of his public life. He now acquired more power than he had ever possessed with Wellington, to whom he had felt himself subordinate; and this new authority he devoted first to establishing friendly relations with France. Public opinion in both countries exhibited hostility, so that the marriage of Isabella II. of Spain and the imprisonment of Pritchard in Tahiti might have led to a quarrel; but Aberdeen was fortunate in having the confidence of Guizot, and it was largely through their efforts that a satisfactory understanding was maintained. He was equally successful in avoiding a rupture with the United States, which might easily have resulted from the question involving the boundary between that country and Canada. The north-east frontier was first settled amicably by the Webster-Ashburton Treaty of 1842, but in 1844 the new democratic administration in the States claimed from Britain the whole of the Pacific coast as far as Russian Alaska. To this demand Peel's Government refused to yield, and Aberdeen crowned his successful term at the Foreign Office with the Oregon Treaty of 1846, which fixed the boundary along the forty-ninth degree of latitude.

In 1845 he supported Peel in a proposal to suspend the duty on foreign corn, and left office with him in July 1846. After Peel's death in 1850, Aberdeen was recognized as leader of the Peelites, and in 1852, at the head of a coalition ministry of his own party and the Whigs, he became first lord of the Treasury. Although united on free trade and on questions of domestic reform generally, a cabinet including Lord Palmerston and Lord John Russell, in addition to Aberdeen, was certain to differ on foreign policy; and contemporaries realized that the task of the prime minister was one of unusual difficulty. "In the present cabinet," wrote Charles Greville, in his *Memoirs,* "are five or six men of equal or nearly equal, pretensions . . every one of these five or six considering himself abler and more important than their premier." Nevertheless, the first year of this administration was successful, and it was due to Aberdeen's steady support that Gladstone's great budget of 1853 was accepted by the cabinet; but the weakness of Aberdeen and of the cabinet soon became apparent in the negotiations which preceded the Crimean War. That the prime minister wished to maintain the peace is unquestionable, but whether he acted wisely to this end is more obscure. His foreign policy was essentially one of peace and non-intervention; but his character is perhaps best described by a writer who says "his strength was not equal to his goodness."

The Vienna note, by which the four powers sought to find terms which were agreeable to both Russia and Turkey, was largely the result of Aberdeen's endeavours; and when Turkey refused to accept the proposed agreement, Aberdeen would not have offered her British support had not the publication of a secret Russian document in Berlin thrown doubt upon the Tsar's intentions. Even then he sought to preserve the peace by presenting a new note early in Dec. 1853 to the two countries; but when he wished to insist upon Turkey's acceptance of these terms, Lord John Russell refused to support him. Rather than risk a break up of the cabinet, Aberdeen consented to a compromise of which advantage was taken by those who desired war; and Turkey was thus enabled to force England with her into the disastrous struggle. The stories of misery and mismanagement from the seat of war deprived the Government of public favour. Russell resigned; and in Jan. 1855, he was followed by Aberdeen, who interpreted a motion by J. A. Roebuck as one of no confidence. He died in London, on Dec. 14th, 1860, and was buried in the family vault at Stanmore. He left four children by his second wife, who died in Aug. 1833; the eldest son, George John James, succeeded as 5th earl; his youngest son, Arthur Hamilton, was created Baron Stanmore in 1893. Aberdeen wrote *An Inquiry into the Principles of Beauty in Grecian Architecture,* which was published in London, 1822. A bust of him by Matthew Noble is in Westminster Abbey, and his portrait was painted by Sir T. Lawrence.

*See* Sir T. Martin, *Life of the Prince Consort* (1875–80); A. W. Kinglake, *Invasion of the Crimea* (1877–88); Spencer Walpole, *History of England* (1878–86), C. C. F. Greville, *Memoirs,* edited by H. Reeve (1888); Spencer Walpole, *Life of Lord John Russell* (1889); Lord Stanmore, *The Earl of Aberdeen* (1893); J. Morley, *Life of Gladstone* (1903).



**ABERDEEN,** a royal and parliamentary burgh, city and county of a city, the capital of Aberdeenshire and chief seaport in the north of Scotland. Pop. (est. 1938) 178,199. It is the fourth Scottish town in population, industry and wealth, and stands on a bay of the North Sea between the mouths of Don and Dee, 130½ mi. N.E. of Edinburgh by the L.N.E.R. Though the residential suburb of Old Aberdeen, extending from the city suburbs to the southern banks of the Don, has a separate charter, history and

parliament there is no distinction between it and New Aberdeen for parliamentary, municipal or other purposes Aberdeen derives its popular name of the "Granite City" from its building stone, which under sunshine after rain gleams white and justifies the town's more poetical designation of the "Silver City by the Sea" The land area of the city is 17 22 sq mi. The burghs of Old Aberdeen and Woodside, and the district of Torry, to the south of the Dee, were incorporated in 1895. After 1928 the city comprised 12 wards and 21 ecclesiastical parishes. It is under the jurisdiction of a council with lord provost, bailies, treasurer and dean of guild. The corporation prior to World War II began to give a good deal of attention to improving the town as a holiday resort.

**Streets and Buildings.**—Roughly, the extended city runs north and south. From the new bridge of Don to the "auld brig" of Dee there is tramway communication via King street, Union street and Holburn road—a distance of over five miles. The name of the ancient castle of Aberdeen, long since demolished, is preserved in Castle street, Castlegate and Castlehill. From Castle street the imposing Union street 70 ft. wide runs west-south-west for nearly a mile, and contains the principal shops and most of the modern public buildings, all of granite. Part of the street crosses the Denburn ravine by a fine granite arch of 132ft. span, portions of the older town fringe the gorge, 50 ft. below the level of Union street. The Trinity Hall of the incorporated trades, originating between 1398 and 1527, and having charitable funds, contains some fine portraits attributed to George Jamesone, who was a native of Aberdeen and one of the earlier British portrait painters. Castle street continues Union street eastwards, and has the fine structures of the municipal and county buildings in Franco-Scottish Gothic (1867–78), the sheriff court house and the town hall, with excellent portraits; from the south-west corner a tower commands a fine view. At the upper end of Castle street stands the Salvation Army Citadel, one of the most imposing "barracks" possessed by this organization. In front of it is the beautiful Market Cross, one of the most notable of its kind in Scotland, an open-arched, hexagonal structure, 21ft. in diameter and 18ft. high, dating originally from 1682, when it replaced an earlier cross, and rebuilt on its present site in 1842. On an eminence east of Castle street are the military barracks, Aberdeen being the depot of supplies for the Gordon Highlanders. The fish market on the Albert Basin is an important centre of activity. The art gallery and museum is at Schoolhill, the Macdonald Hall containing portraits of contemporary artists by themselves being unique of its kind in Great Britain. In Sept. 1925 the city's war memorial was opened; it consists of a domed court, or hall of remembrance, attached to the art gallery and museum. Other extensions, enlarging the facilities of the art gallery and museum, opened at the same time include Cowdray Hall, used for lectures, with the Cowdray Museum of Applied Arts beneath it.

The see of Aberdeen is represented by the Old Cathedral of St. Machar, the only granite cathedral in the British Isles; the beginnings of the present structure date from the 14th century and were completed by Bishops Elphinstone (1484–1511) and Gavin Dunbar (1520). On the flat panelled ceiling are the heraldic shields of princes, noblemen and bishops who shared in its erection. The name of St. Machar (or Mochonna) is referred by tradition to a disciple of St. Columba who founded a chapel here for the conversion of the Picts. The bishopric, traditionally founded at Mortlach (Banffshire) by King Malcolm II. in 1010, in honour of a victory over the Danes, was transferred to Aberdeen by King David I. about the year 1137, a bull of Pope Adrian IV. dated 1157 "confirming all grants made by the kings of the Scots." "The church of Aberdeen" which is mentioned in the same bull, together with the church of St. Machar, is held to refer to the old church of St. Nicholas, of which there remains the Drum and Collison aisles which now link the east and west churches and an eastern crypt. The John Knox parish church was rebuilt in 1911; the Roman Catholic cathedral (Gothic, 1859) is in Huntly street. The episcopal cathedral of St. Andrews is the mother church of the Protestant Episcopal Church in the United States

The Dee is crossed by four bridges, including the railway bridge Till 1832 the old bridge of Dee built by Bishops Elphinstone and Dunbar (and rebuilt in 1718–23 and 1842) formed the only entry to the city from the south The bridge of Don, consisting of five granite arches, was built in 1827–32 The Auld Brig o' Balgownie, said to have been built by Robert the Bruce in the 13th century and celebrated by Byron in the tenth canto of *Don Juan,* is one of the oldest historical bridges still in use The parks and open

BY COURTESY OF LONDON, MIDLAND AND SCOTTISH RAILWAY

THE "AULD BRIG O' BALGOWNIE" AT ABERDEEN, SUPPOSEDLY BUILT BY ROBERT THE BRUCE (1274–1329), AND CELEBRATED IN BYRON'S POEM, "DON JUAN"

spaces include Duthie Park (45 acres), the gift of Miss Elizabeth Crombie Duthie of Ruthrieston; Victoria Park (13 acres) and its extension Westburn Park (13 acres); Stewart Park (11 acres), after Sir D. Stewart, lord provost in 1893; and Hazelhead Park. Capacious golf links and a bathing beach border the sea.

**Education.**—Aberdeen university consists of King's college in Old Aberdeen, founded by Bishop Elphinstone (*q.v.*) in 1494, and Marischal college, in Broad street, founded in 1593 by George Keith, 5th earl Marischal, the two colleges being incorporated together, 1860. In all 34 chairs, 3 readerships and 68 lectureships had been founded by 1943 Handsome new buildings have been erected. Important additions to the resources of the university are the Rowett institute for research in animal nutrition and the Macaulay institute for soil research. Donations have been received for scholarships and bursaries, and the Carnegie Trust has made grants for the erection of buildings.

King's forms a quadrangle with interior court; the Crown Tower and the Chapel, the oldest parts, date from 1500. The choir of the chapel contains the original oak canopied stalls, miserere seats and lofty open screens in French flamboyant style. The principal at the time of the Reformation armed his folk to save the building from the barons of the Mearns (the modern Kincardineshire) after they had robbed St. Machar's of its bells and lead. The building of Marischal college was erected in 1836–41 and has been greatly extended since. Dr. Charles Mitchell gave the great graduation hall and the Mitchell tower (233 ft.), opened in 1895, on the 400th anniversary of the university's foundation. A lintel stone from the old buildings of Marischal college is preserved at the foot of the Mitchell tower, bearing the famous inscription: THAY HAIF SAID · QUHAT SAY THAY LAT THAME SAY, the circumstances giving rise to which are believed to embody the founder's retort to criticisms passed against him for his appropriation (by gift from the Crown) of lands and revenues belonging to the suppressed Cistercian abbey of Deer. A botanic garden was presented to the university in 1899.

Aberdeen, St. Andrews, Edinburgh and Glasgow universities combine to return three members to Parliament. The United Free Church college is in Tudor Gothic (1850). The Grammar school, reputedly first heard of in 1256, was removed in 1861–63 from Schoolhill to new buildings off Skene street. Robert Gordon founded (1729) and Alexander Simpson further endowed (1816) Gordon's Hospital for instruction and maintenance of sons of poor burgesses of guild and trade; in 1881 it became Robert Gordon's college for secondary and technical education.

**Harbour.**—A formerly defective harbour with a bar has been greatly deepened under various Acts since 1773. The north pier,

built partly by John Smeaton in 1775–81 and partly by Thomas Telford in 1810–15, extends nearly 2,000 ft. into the North sea. It increases the depth of water on the bar from a few feet to 32 ft. at high water, and 19½ ft at low water, spring tides. The wet Victoria dock of 29 ac., and with 6,000 ft. of quay, was completed in 1848. Adjoining it is the upper dock. By the Harbour act of 1868, 90 ac. of new ground (in addition to 25 ac. formerly made up) were provided on the north side of the Dee for the Albert basin (with a graving dock), quays and warehouses. A breakwater of concrete, 1,050 ft. long, was constructed on the south side of the stream, and a third floating dock was built in 1911.

**Industry.**—Gray granite has long been quarried, and blocked and dressed paving "setts," curb and building stones and monumental work exported. Aberdeen is an important centre of the Scottish fisheries, the antiquity of which is shown by the mention of the provision of "dried fish from Aberdeen" in the royal wardrobe accounts of the 13th century. Other industries include jute, paper, agricultural materials, sail, rope and timber manufactures, engineering, chemical works, soap and candles and distilling. In the days of wooden ships shipbuilding flourished, the town being noted for its fast clippers, many of which established records in the "tea races." The introduction of trawling revived this to some extent, and there are large shipbuilding and repairing yards.

**History.**—Aberdeen was important as far back as the 12th century. Corporate rights were granted by a royal charter of King William the Lion (1179), from whose times down to the 14th century the Scottish kings maintained a royal residence in Aberdeen. The city received other royal charters later. After it was burned by the English king Edward III in 1336, the new town which was built was called New Aberdeen to distinguish it from Old Aberdeen The burgh records are the oldest in Scotland, being complete with one brief break from 1398 to the present day. During the struggles between the royalists and the Covenanters the city was plundered by both. In the Scottish wars of independence led by William Wallace and Robert Bruce, Aberdeen gave its aid to both. The motto on the city arms of "Bon Accord" traditionally commemorates the watchword used by the Aberdonians aiding Robert Bruce. In 1715 the earl of Mar proclaimed the Old Pretender at Aberdeen.

Once strongly fortified, the gates of the city were all removed by 1770. The importance of Aberdeen as a royal burgh and trading port placed it from the earliest times in the first rank of Scottish towns, a position which its great cathedral and, later, the fame of its university both served to maintain.

BIBLIOGRAPHY.—Among the earlier histories and descriptive accounts of Aberdeen are the works of W. Thom (1811), W. Kennedy (1818), R Wilson (1822), J. Robertson (1839) and J. Gordon (Spalding club, 1842); later works include G. Cadenhead (1876), A. Smith (1882), C G. Burr and A. M. Munro (1886), W. Robbie, *Aberdeen: Its Traditions and History* (1893) and E. H. B. Rodger, *Old Aberdeen* (1902). The burgh charters and other records are published by the Spalding club; also P. J. Anderson, *Charters,* etc. (1890) and A. M. Munro, *Records,* 2 vol. (1900 and 1909). Other Spalding club publications refer to the records of Marischal college (1889, 1898–99), the church of St. Nicholas (J. Cooper, 1888, 1892) and the *Registrum Episcopatus Aberdoniensis* (Cosmo Innes) The works of R. S. Rait (1895), J. M. Bulloch (1895) and F. A. Forbes, *The Founding of a Northern University* (1920) refer more specifically to the history of the two colleges. Mention may also be made of J. Bryce, *Eminent Men of Aberdeen* (1841); A. M. Munro, *Aldermen, Provosts and Lord Provosts of Aberdeen* (1897); and the descriptive handbooks by R. M. Walker and A. M. Munro (1906) and G. M. Fraser, *Historical Walks and Names* (Aberdeen, 1927).

**ABERDEEN,** a city of northeastern Mississippi, U.S., on the Tombigbee river; the county seat of Monroe county. It is on federal highway 45, and is served by the Frisco and the Illinois Central railways. There is a municipal airport. The population was 5,282 in 1950, 4,746 in 1940 and 3,925 in 1930 by the federal census. Industries include lumbering, a bentonite plant, garment plant, frozen food locker and cotton compress. Aberdeen was incorporated in 1837 and named by the founder, Robert Gordon, a Scotchman.

**ABERDEEN,** a city of South Dakota, U.S., the county seat of Brown county. It is in the northeastern part of the state, on federal highway 12, about 270 mi. W. by N. of Minneapolis, Minn., and is served by the Chicago, Milwaukee, St. Paul and Pacific, the Great Northern, the Chicago and North Western and the Minneapolis and St. Louis railroads. The population was 20,976 in 1950.

Aberdeen is the financial and trading centre of the northern part of the state, a fine agricultural region producing grain, potatoes, hay and flax. Retail sales in 1948 amounted to $38,862,000, ranking Aberdeen among the first 15 cities of the United States in retail sales volume per capita. Northern State Teachers college was established there in 1901. Largest teachers college in the state, it had an enrolment of approximately 700 at mid-20th century. It maintains a summer biological station at Enemy Swim lake near Waubay. Aberdeen was settled in 1880 and was chartered as a city in 1883.

**ABERDEEN,** a port of entry, the largest city of Grays Harbor county, Wash., U S., at the head of Grays Harbor, 49 mi. W. of Olympia. It has an area of 10.5 sq.mi.; is built on both sides of the Chehalis and the Wishkah rivers; and adjoins the city of Hoquiam (*q.v.*) on the west, and the town of Cosmopolis (population 1950, 1,161) on the east. The population of Aberdeen increased from 3,747 in 1900 to 18,846 in 1940 (about 20% foreign-born white, Scandinavians predominating) by the federal census and 19,475 in 1950. The three municipalities form one community, with a population of more than 31,000; served by the Northern Pacific, the Union Pacific and the Chicago, Milwaukee, St. Paul and Pacific railways, by autostages and by steamship lines to all world ports. Its products are plywood, pulp and paper, lumber, furniture, shingles, veneer, fish, fisheries by-products and cranberries.

Grays Harbor was discovered in 1792 by Capt. Robert Gray of Boston, on a trading voyage around the world. Aberdeen was founded in 1867 by Samuel Benn, who in 1873 established a cannery, and in 1883 planned the town site. It was incorporated in 1890.

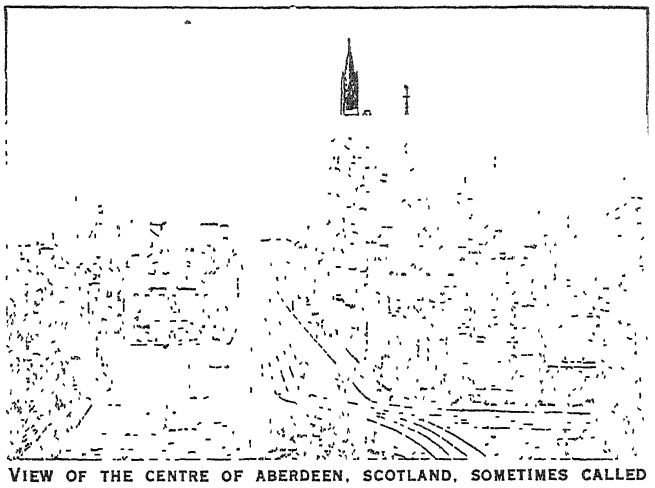
**ABERDEEN AND TEMAIR, JOHN CAMPBELL GORDON,** 1ST MARQUESS OF (1847–1934), P.C., G.C.M.G., G.C.V.O., K.T., second son of the fifth earl of Aberdeen, was born in Edinburgh Aug. 3, 1847. He was educated at Oxford and succeeded his brother as sixth earl of Aberdeen in 1870, taking his seat in the house of lords early in 1873 and at once plunging into committee work. After being lord high commissioner to the general assembly of the Church of Scotland from 1881 to 1885—an office he again filled in 1915—William Ewart Gladstone appointed him lord lieutenant of Ireland in his short administration (Feb.–July) of 1886. Soon after the Liberals' next accession to power he became governor-general of Canada (1893) and after his return to England in 1898 took little part in politics. In Dec. 1905 he was again appointed lord lieutenant of Ireland; he held this office till May 1915, and in the following January received the title of marquess of Aberdeen and Temair (Tara). Both in Canada and in Ireland Lord Aberdeen's terms of office were distinguished by the cordial relationship which he maintained with the different peoples over whom he presided. He died March 7, 1934, and was succeeded by his son, the earl of Haddo (1879– ).

In 1877 Lord Aberdeen married the Hon. Ishbel Maria Majoribanks, a daughter of Lord Tweedmouth.

See *We Twa: Reminiscences of Lord and Lady Aberdeen* (1925).

**ABERDEEN PROVING GROUND** is located on the west side of the upper Chesapeake bay, U.S., covering about 75,000 ac. between Bush river and Swan creek in Maryland. A U.S. army installation under the jurisdiction of the ordnance department, it was originally acquired Oct. 16, 1917, and was made a permanent army post in Jan. 1919. Research and development of all ordnance items, including test activities and computations of firing tables and other technical data, are primary functions of the proving grounds. The ordnance school, ordnance department board, Aberdeen Ordnance depot and an air force base, Phillips field, are also located there. Some of the testing activities are performed at White Sands, N.M.

**ABERDEENSHIRE,** a northeastern county of Scotland, bounded north and east by the North sea, south by Kincardine, Angus and Perth and west by Inverness and Banff. It has a



coast line of 65 mi.; and is the sixth Scottish county in land area, occupying 1,261 440 ac. or 1,971 sq.mi. The county is generally hilly, since from the south-west, near the centre of Scotland, the Grampians send out various branches in a general north-easterly direction. The county is watered by the rivers Dee, Don, Ythan, Ugie and Deveron—names, especially the two first, associated with some of the finest valley scenery on the eastward slope of Scotland. The upper valley of the Dee, about Braemar, penetrates the central mass of crystalline schists belonging to the metamorphic rocks of the eastern highlands, with extensive intrusions of later granites, which, on the border with Banffshire, rise in the fine mass of Ben Macdhui (4,296ft.) to a height second only to that of Ben Nevis among the mountains of the British Isles. This mountain commands views of one of the most beautiful parts of the central highlands, with the summits of Braeriach (4,248ft.), Cairntoul (4,241ft.) and Cairngorm (Banffshire) near by, the columnar cliffs of Corrie Etchachan, and Loch Avon in its deep gully, 2,500ft. above sea-level Among many other heights, "dark" Lochnagar, south-east of Braemar, is famed through a well-known song of Byron; and Benwachie, on the Banffshire border, through John Imlah's verse "O gin I were where Gadie rins." The shire is popularly divided into five districts Of these the first is Mar, mostly between Dee and Don, the southern half of the county with the city of Aberdeen. The soil on the Dee is sandy, and on the Don loamy. The second district, Formartine, between the lower Don and Ythan, has a sandy coast, succeeded inland by a clayey, fertile, cultivated tract, and then by low hills, moors, mosses and tilled land. Buchan, the third district, lies north of the Ythan, and comprises the north-east part of the county. The surface is bare, low, flat or gently undulating and in places peaty. The coast is in parts bold and rocky, and at the Bullers of Buchan, 6m. south of Peterhead, the sea enters a basin by a natural arch and boils up violently in stormy weather. Buchan Ness is the most easterly point of Scotland. The fourth district, Garioch, in the centre of the shire, is beautiful, undulating, loamy and fertile. Strathbogie, the fifth district south of the Deveron, mostly consists of hills, moors and mosses.

**Geology.**—The schists extend east from the central mass to Formartine and Peterhead. East down Dee and Don and north across the plain of Buchan towards Rattray head and Fraserburgh there is a development of biotite gneiss, partly of sedimentary and perhaps partly of igneous origin. A belt of slate quarried for roofing purposes runs along the west border of the county from Turriff by Auchterless and the Foudland hills towards the Tap o'Noth near Gartly. The metamorphic rocks have been invaded in almost every part of the county by igneous materials, some before, and by far the larger series after the folding of the strata. There are chalybeate springs at Peterhead and Pannanich near Ballater. The later granites subsequent to the plication of the schists have a wide distribution on the Ben Macdhui and Ben Avon range, and on Lochnagar; they stretch east from Ballater by Tarland to Aberdeen and north to Bennachie. Isolated masses appear at Peterhead and at Strichen. The Aberdeen granites have been widely used for building and paving, and extensively quarried at Rubislaw, Peterhead, Kemnay and elsewhere. The glacial deposits in the county indicate an eastward movement off the high ground at the head of Dee and Don, while the mass spreading outwards from the Moray Firth invaded the low plateau of Buchan; but at a certain stage there was a marked defection northwards parallel with the coast, as proved by the deposit of red clay north of Aberdeen. At a later date the local glaciers laid down materials on top of the red clay. The rivers abound with salmon and trout. Loch Muick, the largest of the few lakes in the county, 1,310ft. above the sea, 2½m. long and ⅓ to ½m. broad, lies some 8½m. south-west of Ballater, and has Altnagiuthasach, a royal shooting-box, near its south-west end. Red deer (in Braemar), grouse, and partridges are plentiful.

The climate of the upper Dee and Don valleys has a reputation as the driest and most bracing in the British isles, and grain is cultivable up to 1,600ft. above sea-level—considerably higher than elsewhere in the north of Great Britain. At Loch Muick vegetables, currants, laurels and roses flourish; the larch grows well, and elsewhere in Braemar natural timber, especially Scots fir in addition to larch, is particularly fine. Ash-trees, 5ft. in girth, are found at 1,300ft. elevation.

**History.**—The country now forming the shires of Aberdeen and Banff was originally peopled by northern Picts, whom Ptolemy called Taixali. Evidence of effective Roman occupation is lacking, though so-called Roman camps have been discovered on the upper Ythan and Deveron. Traces of the native inhabitants, however, are numerous. Weems or earth-houses are fairly common in the west. Relics of crannogs or lake-dwellings exist at Loch Ceander, or Kinnord, 5m. N E of Ballater, at Loch Goul in the parish of New Machar, and elsewhere. Duns or forts occur on hills at Dunecht, where the dun encloses an area of two acres, Barra near Old Meldrum, Tap o'Noth, Dunnideer near Insch and other places. Monoliths, standing stones and stone circles abound, and there are many early Christian sculptured stones. Efforts to convert the Picts were begun by Ternan in the 5th century and continued by Columba (who founded a monastery at Old Deer), Drostan, Maluog and Machar, but dissensions within the Columban Church and the expulsion of the clergy from Pictland by the Pictish king Nectan in the 8th century, undid most of the progress that had been made. The Vikings and Danes periodically raided the coast, but when (1040) Macbeth ascended the throne of Scotland the Northmen, under the guidance of Thorfinn, refrained from further trouble in the north-east. Macbeth was afterwards slain at Lumphanan (1057), a cairn on Perkhill marking the spot. Along with numerous Anglo-Saxon exiles after the Norman conquest of England there also came to Aberdeenshire Flemings who introduced various industries, Saxons who brought farming, and Scandinavians who taught nautical skill. The Celts revolted more than once, but Malcolm Canmore and his successors crushed them and confiscated their lands. In the 12th and 13th centuries some of the great Aberdeenshire families arose, including the earl of Mar (*c.* 1122), the Leslies, Freskins (ancestors of the dukes of Sutherland), Durwards, Bysets, Comyns and Cheynes, and in most cases their founders were immigrants. The Celtic thanes and their retainers slowly fused with the settlers. They declined to take advantage of the disturbed condition of the country during the wars of the Scots independence, and made common cause with the bulk of the nation. Though John Comyn (d. 1300?), one of the competitors for the throne, had considerable interests in the shire, his claim received locally little support. In 1296 Edward I. made a triumphal march to the north to terrorize the more turbulent nobles. Next year William Wallace surprised the English garrison in Aberdeen, but failed to capture the castle. In 1303 Edward again visited the county, halting at the castle of Kildrummy, then in the possession of Robert Bruce, and made Aberdeen his headquarters during several months. After Robert Bruce's death (1329) there was intermittent anarchy in the shire. Aberdeen itself was burned by the English in 1336, and the resettlement of the districts of Buchan and Strathbogie occasioned constant quarrels on the part of the dispossessed. Moreover, the Crown embroiled itself by trying to subdue some of the Highland chieftains. This policy culminated in the invasion of Aberdeenshire by Donald, lord of the Isles, who was, however, defeated at Harlaw, near Inverurie, by the earl of Mar in 1411. In the 15th century Sir Alexander Forbes was created Lord Forbes (*c.* 1442), and Sir Alexander Seton Lord Gordon in 1437 and earl of Huntly in 1445. Bitter feuds raged between these families but the Gordons' domains, already vast, were enhanced by the acquisition, through marriage, of the earldom of Sutherland (1514). Meanwhile commerce with the Low Countries, Poland and the Baltic had grown apace, Campvere, near Flushing in Holland, becoming the emporium of the Scottish traders, while education was fostered by the foundation of King's college at Aberdeen in 1494 (Marischal college followed a century later). At the Reformation so little intuition had the clergy of the drift of opinion that at the very time that religious structures were being despoiled in the south, the building

and decoration of churches went on in the shire. The change was acquiesced in without much tumult, though rioting took place in Aberdeen and St. Machar's cathedral in the city suffered damage. The 4th earl of Huntly offered some resistance, on behalf of the Catholics, to the influence of Lord James Stuart, afterwards the regent, Moray, but was defeated and killed at Corrichie on the Hill of Fare in 1562. As years passed it was apparent that Presbyterianism was less generally acceptable than episcopacy, of which system Aberdeenshire remained for generations the stronghold in Scotland. In 1638 the National Covenant was ordered to be subscribed, a demand so grudgingly responded to that the earl of Montrose visited the shire in the following year to enforce acceptance. The Cavaliers, not being disposed to

VIEW OF THE CENTRE OF ABERDEEN, SCOTLAND, SOMETIMES CALLED "THE GRANITE CITY," THE CHIEF CITY OF ABERDEENSHIRE

yield, dispersed an armed gathering of Covenanters in the affair called the Trot of Turriff (1639), in which the first blood of the Civil War was shed. The Covenanters obtained the upper hand in a few weeks, when Montrose appeared at the bridge of Dee and compelled the surrender of Aberdeen, which had no choice but to cast in its lot with the victors. Montrose, however, soon changed sides, and defeated the Covenanters under Lord Balfour of Burleigh (1644), and again after a stiff fight on July 2, 1645, at Alford. Peace was temporarily restored on the "engagement" of the Scots commissioners to assist Charles I. On his return from Holland in 1650 Charles II was welcomed in Aberdeen, but in little more than a year General Monk entered the city at the head of the Cromwellian regiments. The English garrison remained till 1659, and next year the Restoration was effusively hailed, and prelacy was again in the ascendant. After the Revolution (1688) episcopacy passed under a cloud, and as George I was antipathetic to the clergy, it happened that Jacobitism and episcopalianism came to be regarded in the shire as identical. The earl of Mar raised the standard of revolt in Braemar (Sept. 6, 1715); a fortnight later James was proclaimed at Aberdeen cross; the Pretender landed at Peterhead on Dec. 22, and in Feb. 1716 he was back again in France. The collapse of the first rising ruined many of the lairds, and when the second rebellion occurred 30 years afterwards the county in the main was apathetic, though the insurgents held Aberdeen for five months, and Lord Lewis Gordon won a trifling victory for Prince Charles Edward at Inverurie (Dec. 23, 1745).

**Population and Government.**—The population in 1938 was estimated at 325,231. In 1931, only 777 spoke Gaelic, all of whom spoke English also. As late as 1830 Gaelic was the common tongue almost throughout Braemar at least. The chief towns, with populations (est. 1938), are the large burgh of Aberdeen (178,199), and Peterhead (13,056), Fraserburgh (10,388), Huntly (3,985), Inverurie (4,728), and Turriff (2,562) of the ten small burghs. Aberdeen, Kintore and Inverurie are royal burghs. The supreme court of justiciary sits in Aberdeen to try cases from the counties of Aberdeen, Banff and Kincardine. The three counties are under a sheriff, and there are three sheriffs-substitute resident in Aberdeen, who sit also at Fraserburgh, Huntly and Peterhead The county, with Kincardineshire, sends three members to parliament. The county town, Aberdeen, returns two members.

**Agriculture.**—Except in favoured tracts, as in Formartine and Garioch, the glacial drift soils are generally poor, gravelly or peaty; but in no part of Scotland has careful cultivation more successfully increased productivity. About two-thirds of the population depend on agriculture. Farms are small compared with those in the southeastern counties. Of the 9,889 holdings in 1938 almost half were between 5 and 50 ac. Oats are the predominant crop (172,055 ac. in 1938), wheat has practically gone out of cultivation (188 ac.), but turnips and swedes (73,698 ac.) and barley (11,669 ac.) are grown. The county is by far the greatest for oat growing in Scotland and is second only to East Lothian for barley. Great numbers (185,277 in 1938) of the home-bred crosses of cattle are fattened for London and local markets, and Irish animals are imported on an extensive scale for the same purpose.

**Fisheries.**—The white and herring fishery is the next most important industry to agriculture, its development having been due almost exclusively to the introduction of steam trawlers Aberdeen is the chief Scottish centre for trawling and great line fishing, and the chief port for white fish. Fraserburgh is one of the largest centres of the North sea herring fishing. Haddocks are salted and rock-dried (speldings) or smoked (finnans). The ports and creeks are divided between the fishery districts of Peterhead, Fraserburgh and Aberdeen, the last of which includes also three Kincardineshire ports. The herring season for Aberdeen, Peterhead and Fraserburgh is from June to September, at which time the ports are crowded with boats from other Scottish districts. There are valuable salmon-fishings—rod, net and stake-net—on Dee, Don, Ythan and Ugie.

**Communications.**—From the south Aberdeen city is approached by the L.M.S.R. (via Perth, Forfar and Stonehaven), and the L.N.E.R. (via Dundee, Montrose and Stonehaven). A line of the latter company runs via Kintore and Huntly to Keith and Elgin. Branch lines from Aberdeen to Ballater by Deeside, from Aberdeen to Fraserburgh (with a branch at Maud for Peterhead and at Ellon for Cruden bay and Boddam), from Kintore to Alford, and from Inverurie to Old Meldrum and also to Macduff. By sea there is regular communication with London, Leith, Newcastle and Hull, Inverness, Wick and other ports, the Orkneys and Shetlands, and the Continent. The highest macadamized road crossing the East Grampians rises to a point 2,200 ft. above sea level.

**ABERDOUR,** village and civil parish, Fifeshire, Scotland. Pop. (1931), 2,055. On the shore of the Firth of Forth, 17½ mi. N.W. of Edinburgh by the L.N.E.R., 7 mi. N.W. of Leith by steamer, it is a favoured bathing resort. There are ruins of a castle and a church with fine Norman work. About 3 mi. S.W. is Donibristle House, the seat of the earl of Murray (Moray). The island of Inchcolm, or island of Columba, ¼ mi. from shore, is in the parish. Remains of 13th-century fresco have been found.

**ABERDOVEY** (ăb-ur-dŭv'ĭ) (ABERDYFI), a village on the north side of the Dyfi Estuary, Merionethshire, Wales. Population (1931) 1,203. Its site has associations in Welsh folklore with coastal submergence (*see* CARDIGANSHIRE). During the 17th, 18th and 19th centuries it had a considerable coasting and fishing trade, the export of slates from Corris and Aberllefenni being considerable. Aberdovey also exported lead ore from the mines of the Dyfi region. With the development of private motor traffic on a large scale after 1918 Aberdovey became increasingly a resort for visitors from the large towns of England.

**ABERFOYLE,** village and civil parish, Perthshire, Scotland, 34¼ mi. N.W. of Glasgow by the L.N.E.R. Population (1931) 1,014. The village is at the base of Craigmore (1,271 ft. high) and on the Laggan, a headwater of the Forth In 1885 the duke of Montrose built a road over the east shoulder of Craigmore to the Trossachs but this does not take motor traffic. The Laggan drains the small lochs Ard and Chon, the first of which is the scene of incidents in Scott's *Rob Roy*. There are slate quarries on Craigmore.

**ABERGAVENNY** (ăb ur-gĕn'ĭ or ăb-ur-gă-vĕn'ĭ), municipal borough, Monmouthshire, England, at the converge of roads from Crickhowell, Ross, Hereford, Newport and Merthyr, at the confluence of the Gavenny with the Usk Population (1938) 7,925. Area, 3 75 sq mi. There are evidences of the early occupation of the area on the hills around and the focus which became Abergavenny was the Roman Gobannium, a small fort guarding the road up the Usk. The town grew under the protection of the Norman lords of Abergavenny and there are remains of a castle built by Hamelin de Ballon in the 11th century. The mediaeval walled town contained a Benedictine monastery which later became the church of St. Mary, which contains many interesting monuments. Owing to its situation, the town was frequently embroiled in the border warfare of the 12th and 13th centuries and was burned by Owen Glendower (*q.v.*) in 1404 At the dissolution of the priory part of its endowment went towards a free grammar school. In 1639 Abergavenny received a charter of incorporation with bailiff and burgesses. Like most towns of similar history it showed strong conservative tendencies during the Civil Wars when the town suffered badly at the hands of Fairfax (1646), and again in 1688 when it lost its charter for its strong Jacobean demonstrations. The market was important as early as 1200 and further reference is made to it in 1657, but with the better roads and greater movement of the 18th and 19th centuries cattle and horse fairs became more important. In the 18th and early 19th centuries Abergavenny prospered as a market and social centre. It was also famous for its Welsh flannel Abergavenny was incorporated in 1899. Its boundaries were extended in 1935. It is in the parliamentary division of Monmouth.

**ABERIGH-MACKAY, GEORGE ROBERT** (1848–1881), Anglo-Indian writer, is known by his famous *Twenty-one Days in India* (1878–79), a satire upon Anglo-Indian society and ways of thinking.

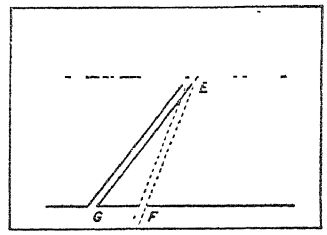
**ABERNETHY, JOHN** (1680–1740), Irish Presbyterian divine, was born at Coleraine, county Londonderry, on Oct. 19 1680. He was educated at Glasgow, Edinburgh and Dublin, and was pastor of a church at Antrim for 14 years. In 1717 he was assigned by the synod to Usher's Quay, Dublin. He declined to obey, and remained at Antrim. This refusal became a test case of the authority of the ecclesiastical courts, and Irish Presbyterianism was split into two camps of "subscribers" and "non-subscribers" Out-and-out evangelical as John Abernethy was, there can be no question that he and his associates sowed the seeds of that after-struggle (1821–40) in which, under the leadership of Dr. Henry Cooke, the Arian and Socinian elements of the Irish Presbyterian Church were thrown out. In 1726 the "non-subscribers," in spite of pleading against separation by Abernethy, were cut off from the Irish Presbyterian Church. In 1730, although a "non-subscriber," he was invited to Wood Street, Dublin, whither he removed. In 1731 Abernethy made a stand against the Test Act, "against all laws that, upon account of mere differences of religious opinions and forms of worship, excluded men of integrity and ability from serving their country." He was nearly a century in advance of his age in his repudiation of tests and disabilities. He had to reason with those who denied that a Roman Catholic or Dissenter could be a "man of integrity and ability." His *Tracts*—afterwards collected—did fresh service, generations later, and his name is honoured by all who love freedom of conscience and opinion.

*See* Dr. Duchal's *Life*, prefixed to *Sermons* (1762); *Diary* in ms., 6 vols. 4to; Reid's *Presbyterian Church in Ireland*, iii. 234.

**ABERNETHY, JOHN** (1764–1831), British surgeon, was born in London on April 3 1764. He was apprenticed in 1779 to Sir Charles Blicke, then assistant surgeon to St. Bartholomew's Hospital, and studied under Sir William Buzard at the London Hospital and under John Hunter. When Blicke became surgeon to the hospital, Abernethy became assistant surgeon. He began to lecture to students in his house. The lectures were so crowded that the governors of the hospital decided to build a regular lecture theatre. Abernethy's best known work is *Surgical observations on the constitutional Origin and Treatment of Local Diseases* (1809). He had enjoyed great celebrity in private practice, enhanced it is said, by his rough manners. He was surgeon to the hospital 1815–27, and died at Enfield April 20 1831.

A collected edition of his works was published in 1830. A biography, *Memoirs of John Abernethy*, by George Macilwain, appeared in 1853.

**ABERRATION IN OPTICS, SPHERICAL AND CHROMATIC**, the deviation of light rays from certain points through which they should pass in order to satisfy the conditions necessary for distinct focus. *Spherical* aberration results in distortion of the image, and *chromatic* aberration produces coloured fringes around an otherwise white image (*See* OPTICS; PHOTOGRAPHY *Apparatus*)



**ABERRATION OF LIGHT.** This is an astronomical phenomenon depending on the fact that light is not propagated instantaneously Our observations of the heavenly bodies are taken from the earth, a planet whose speed of motion is not incomparably smaller than that of the light; the result is that the apparent position of a star in the sky does not correspond to its true direction from the earth We are accustomed to assume intuitively that a body is "where we see it to be"; or, since the distance cannot always be judged, that at any rate it is in the direction in which we see it But actually vision gives only an indirect acquaintance with its position. That which affects our eyes is the light which has travelled to us from the object; we have, therefore, to take into consideration the circumstances of propagation of the light. It is well known that a light-ray changes direction in passing from one transparent medium to another, *e g*, water to air, and that its course is curved in a medium of varying density such as our atmosphere; an object seen by these dislocated or curved rays is displaced from its correct position, and the corresponding correction for *refraction* by the earth's atmosphere is highly important in determining the positions of stars The correction for *aberration* is also concerned with the propagation of light; it arises from the fact that our actual judgment of the direction of a ray involves a combination of the earth's motion and the motion of the light.

The most elementary explanation can be given in terms of the old corpuscular theory of light—which was the theory accepted at the time aberration was discovered. If we think of the ray of light as a stream of missiles proceeding from the star with a speed of 186,0000m. a second, it is clear that the apparent direction from which the missiles come will be affected by our own velocity if that is not too insignificant in comparison. A common illustration is that of a man walking through a rain-storm with the drops falling vertically; the faster he walks, the more inclined is the position in which he must hold his umbrella to shield off the "missiles." The argument can be re-stated in terms of the wave theory of light without essential alteration; but reference should be made to an account of that theory for an explanation of the signification of "rays of light."

A rough way of alining the direction of a star is to point a long narrow tube so that we can see the star through it. The alinement is given by the two apertures at the ends of the tube, which must be such that the small pencil of rays admitted through one can make an exit through the other and thus reach the observer's eye. The upper part of the diagram shows the rays of light coming from a star; the upper aperture E admits a narrow beam which continues in the original direction, so that F is the position in which the exit aperture has to be placed. Suppose that whilst the light travels the distance E F the earth moves through a distance G F; then the required direction of our tube is G E. It will then admit the light at E, and, by the time the light has travelled down the tube, the lower aperture will have reached the position F and the light will pass out. It will be seen that the tube G E does not point in the true direction of the star F E. The same principle applies when the tube is furnished with lenses, as in a telescope.

The alinement is the same whether the tube is long or short, and we can conveniently appreciate the relative proportions if we take E F to be 186,000 miles. The light then takes 1 second to pass from E to F; and in 1 second the earth travels in its orbit 18½m, represented by G F. Thus G F is $\frac{1}{10,000}$ of E F. The greatest possible angle between the observed direction and the true direction is $\frac{1}{10,000}$ of a radian, or more accurately 20·47″;

this is called the *constant of aberration* For comparison the apparent radius of Jupiter is about 20″; so that (when the aberration is a maximum) we see the centre of Jupiter when we are actually looking towards the edge of disc. As the direction of the earth's motion changes throughout the year so the direction of the aberration displacement of the star changes; the star is always displaced towards the "apex of the earth's way," *i.e.*, the point of the sky towards which the earth's motion is directed. The star apparently moves in an ellipse around its true position as centre, making a circuit once a year. For a star at the pole of the ecliptic this ellipse is a circle of radius 20·47″; for other parts of the sky the path may be regarded as a parallel circle which is projected into an ellipse by foreshortening. The major axis of the ellipse is always 20·47″, but the minor axis depends on the latitude (*i.e.*, distance from ecliptic) of the star.

**Discovery of Aberration.**—The discovery of the aberration of light in 1725, due to James Bradley (1693–1762) is one of the most important in the whole domain of astronomy; and in pure physics it has provoked a succession of investigations culminating in the theory of relativity. It was entirely unexpected, and it was only by extraordinary perseverance and perspicuity that Bradley was able to explain it in 1729. The discovery arose in the course of an attempt to discover whether the stars had appreciable parallaxes. We now know that stellar parallaxes are less than a second of arc, and the first authentic parallax was not measured until a century later. Many observers had, however, claimed to have discovered such parallaxes. In 1680 Jean Picard in his *Voyage d'Uraniborg* stated, as the result of ten years' observations, that the Pole Star exhibited variations of position amounting to 40″ annually; some astronomers endeavoured to explain this by parallax, but the motion was at variance with that which parallax would occasion. J. Flamsteed, from measurements in 1689 and succeeding years with his mural quadrant, concluded that the declination of the Pole Star was 40″ less in July than September. R. Hooke in 1674 concluded from his observations that γ Draconis was 23″ more northerly in July than October.

When James Bradley and Samuel Molyneux entered this sphere of astronomical research in 1725 there was much uncertainty as to whether genuine stellar parallaxes had been detected or not; and it was with the intention of answering this question definitely that they erected a large telescope in the house of the latter at Kew. They determined to re-investigate γ Draconis, a star selected because it passed almost through the zenith in the latitude of London; its position would therefore not be affected by troublesome and uncertain corrections for refraction. The telescope constructed by George Graham (1675–1751), a celebrated instrument-maker, was affixed to a vertical chimney-stack; the eye-piece could be moved a little laterally so as to measure deviation from the vertical by means of a screw, the vertical being fixed by a plumb-line. The first observations were made on the 3rd, 5th, 11th, 12th Dec., 1725. On the 17th Bradley found the star to be moving southwards, and confirmed this on the 20th. (The change of position by aberration at this time of the year is rapid, and amounts to about 3·2″ in ten days.) The star was found to continue its southerly course until March when it was about 20″ south of the December position. By the middle of April it was apparent that it was returning north again. In September it reached its northerly limit, the extreme range between March and September being 40″.

Although the observers were seeking an apparent shift of the star, they immediately realized that what they had found could not be attributed to parallax. The maximum range of parallactic shift for γ Draconis should be between June and December. Aberration and parallax are easily distinguished by this three months' difference of phase; the displacement of a star due to aberration is always at right angles to that due to parallax. Bradley and Molyneux discussed several hypotheses in the hope of arriving at an explanation. One hypothesis was that the direction of the earth's axis and therefore of the plumb-line varied, causing an apparent displacement of the star when its position was measured with respect to the plumb-line Observations were therefore made of another star on the opposite side of the pole; from a comparison of the displacements with those of γ Draconis it was found that they could not be explained by a shift of the earth's axis The precaution, however, was fruitful; for by long continued observation Bradley ultimately established that shifts due to a change of the earth's axis actually occurred; and he was led to his second famous discovery—*nutation*. Bradley realized that observations of many more stars were required in order to determine the laws governing this mysterious effect. For this purpose he set up a more convenient telescope at the Rectory, Wanstead, the residence of the widow of his uncle, James Pound, who had guided him in his early astronomical work. This telescope, erected in Aug. 1727 had a range of 6¼° on each side of the zenith and thus covered a much larger area of the sky than the Kew instrument. Fifty stars were kept under close observation. Bradley disentangled from these observations the conclusion that a star had its extreme declinations at the times of the year when it passed through the zenith at 6 o'clock morning or evening.

The true theory of the phenomenon was discovered by an accident reminding us of the more apochryphal story of Newton and the apple-tree. Sailing on the Thames, Bradley noticed the shifting of the vane on the mast, as the boat altered her course; the shift was not due to unsteadiness of the wind, but to the combining of the changing motion of the boat with the steady velocity of the wind. This suggested that the changing direction of the ray from the star was the result of combining the changing motion of the earth with the steady velocity of the starlight. The finite velocity of light had been discovered by Roemer 60 years earlier

**Astronomical Effects.**—In modern astronomy the aberration due to the earth's orbital motion is included along with precession and nutation as part of the "star correction" applied to reduce from Apparent to Mean Place. A small correction for diurnal aberration is also applied, arising from the motion of the observer caused by the diurnal rotation of the earth. For planets and comets a different procedure is adopted. It must be remembered that, even after allowing for the aberration, we see the body not where it is now but where it was when the light left it. Thus the corrected direction F E joins the position of the earth at the instant of observation to the position of the planet some minutes or hours before. Using the previous diagram but with a new connotation, let E be the planet when the light left it, and let F be the position of the earth when the light arrives. Whilst the light travels from E to F the earth travels from G to F, so that the *apparent direction* of the planet G E is the actual direction joining the positions of the earth and planet *at the time when the light left the planet.* Accordingly we do not trouble about the hybrid direction F E. We accept G E uncorrected; but we apply a correction to the time of observation, antedating it by the light-time. This simple procedure is inapplicable to the stars whose light-time is many years, because it assumes that the earth's velocity has been constant throughout the interval. But it answers a question often raised—whether we ought not to apply a correction on account of the aberration due to the motion of the whole solar system through space towards a point in Hercules. This motion, being uniform, admits of the above treatment; and the answer is that no correction is required provided that it is understood that the observation relates to the state of things when the light left the star; the aberration rather helpfully "puts back the sun" to the earlier date which must in any case pertain to the star.

Since the velocity of light is known with great accuracy the observed value of the constant of aberration determines the earth's orbital velocity. This can also be calculated when we know the radius of the earth's orbit from observations of the solar parallax. There has long been a rivalry between the constant of aberration and the solar parallax as to which shall provide the more accurate determination; at present the degree of

accuracy seems to be about equal, and the two methods are in satisfactory accord.

**Aberration and Aether.**—In the explanation of aberration we pictured the light as travelling in a straight line from the star uninfluenced by the motion of the earth carrying the observer. On the wave theory this would not be true if the aether in our neighbourhood were carried along with the earth; for when the light reaches this moving region of the aether its course will be disturbed, the motion of the aether (if the phrase has any literal meaning) being superposed on the ordinary velocity of the light traversing it. According to the modern idea of the atom, introduced by Rutherford in 1911, the electrons and atomic nuclei are so minute that the aether can slip through the void interior of the atom as easily as through the solar system, and there is no longer any reason to anticipate a convection; but in the last century it seemed almost contrary to reason to imagine solid matter pushing its way through the aetherial medium without serious disturbance. Apart from this prejudice, experimental evidence in the last century suggested that the aether in the lower part of our atmosphere was travelling with the earth, and further that moving matter such as a stream of water partially dragged the aether with it. Thus in 1818 Arago pointed out that the refraction by a prism (depending on the ratio of the velocities of light in air and glass) ought to be altered by the motion of the prism through the aether; since no such alteration was observed he concluded that the surrounding aether shared the motion of the prism. Fresnel explained this effect by a "dragging co-efficient," his hypothesis being that the "condensed" aether carrying the light inside the prism did not have the full motion of the prism but was only partially dragged in the same direction This was apparently verified by Fizeau in 1851, who sent light in opposite directions round a circulating stream of water and thus studied its velocity with and against the current. In 1871 Airy performed his water-telescope experiment (originally suggested by Boscovitch) in which he measured the constant of aberration with a telescope that had its tube filled with water. Reasoning crudely, the aberration should have been increased, since the velocity of light in water is less than in air; but the normal value was obtained. Fresnel had already predicted that there would be a compensation when account was taken of the alteration of refraction at the surface of the moving liquid.

In the light of Fresnel's theory, it seemed to emerge from these results that the aether-drag was limited to the interior of the moving bodies, and that its effects were compensated by changes of refraction at the surface of the bodies, except when (as in Fizeau's experiment) differential motions were concerned. Thus the aether just outside the solid earth would be stagnant as the theory of aberration requires. But in 1887 Michelson and Morley made a much more delicate attempt to detect the difference of velocity of the earth and surrounding aether (*see* RELATIVITY); this seemed to decide that the aether was carried with the earth. Thus the conflict between stagnant and convected aether was brought to a head, the former being demanded by astronomical aberration and the latter by the Michelson-Morley experiment and certain later experiments involving similar principles.

The astronomical observations prove that the ray as it reaches the telescope is travelling in the same direction as when it started from the star; this, however, does not entirely rule out possible motions of the aether near the earth. It was shown by Sir George Stokes (1845) that the necessary and sufficient condition was that the motion should be of the kind known as "irrotational" in hydrodynamics. This would allow the kind of disturbance which might be anticipated from the earth's pushing its way through a fluid aether, since there is a well-known irrotational solution of the problem of a sphere moving through a liquid; but it does little to help the present difficulty since it involves a sliding of the aether over the surface of the sphere, which is precisely the point denied by the Michelson-Morley experiment. If the aether is allowed to be compressible (the density having, however, no effect on the velocity of light) an irrotational solution can be found which does not involve any slip of the aether at the earth's surface. This was pointed out by Planck, but the condensation required is so extreme, that the loop-hole cannot be considered very seriously. The reconciliation was ultimately effected by the theoretical investigations of Lorentz and Larmor. Their work showed that the electrical structure of matter involves an alteration of length of all material objects in the direction of their velocity through the aether, which would compensate the effect looked for in the Michelson-Morley experiment—confirming a suggestion originally made by F. [illegible] allowance is made for this contraction, none of the numerous experiments are capable of testing the relative motion of the earth and aether. The position about 1900–05 can be summed up as follows:—The earth moves through the stagnant aether without disturbing it, as the original explanation of astronomical aberration demands. The objection that bodies carried on the earth show no effects of this relative motion falls to the ground because it turns out that in all the experiments the effects are precisely compensated. For the further developments originating from these ideas reference should be made to the article RELATIVITY.

Astronomical aberration provides no means of determining a uniform motion through the aether; this will be apparent from what we have said as to the aberration from the motion of the solar system through space. But it [illegible] means of determining differences of velocity, such as [illegible] in the earth's orbital motion at different times of the year. Equally it can test any possible difference of aether-drift at different levels, *e.g.*, at the top and bottom of a mountain. Prof. D C. Miller's recent attempt to test this by performing the Michelson-Morley experiment at the top of a mountain appears to us to have been misconceived; for even if (contrary to current theory) the experiment can reveal aether-drift, it is by no means comparable in accuracy with the test by astronomical observations, which assure us that the light of the stars is not deflected by any change of the aether current between a mountain observatory and the sea-level. All observable effects of aberration are due to relative velocity or change of velocity. On absolute velocity it is silent; and there is reason to believe that all other experiments are silent also—a conclusion which has led to the principle of relativity.

The practical application in astronomy is treated in all text-books on spherical astronomy For the long controversy regarding stagnant and convected aether *see* J. Larmor, *Aether and Matter* (1900) and E. T Whittaker, *A History of the Theory of Aether and Electricity* (1910). (A. S. E.)

**ABERSYCHAN:** *see* PONTYPOOL.

**ABERTILLERY,** urban district, Monmouthshire, England, 16 mi. N W. of Newport, on the G.W.R. Pop. (1938) 28,320. Area, 10.1 sq mi. It lies in the mountainous mining district of Monmouthshire and Glamorganshire, in the valley of the Ebbw Fach, and the large industrial population is mainly employed in the numerous coal mines, ironworks and tinplate works. The upper reaches of the valley were formerly important as iron smelting regions and coal was worked early at Abertillery. This region, like most of South Wales, suffered badly in the depression of the 1930s.

**ABERT RIM,** a striking rock formation in south central Oregon, U.S.A., is one of the largest fault scarps in the world. The rim runs along the eastern edge of Abert lake for 19 mi., rising about 2,000 ft. above the lake, and has an 800-ft. lava cap ending in a sheer precipice.

Lieut. John Charles Frémont and his men discovered Abert Rim and lake in Dec. 1843. Legend says that a party of Indians chased a wagon train of white people across the level plateau which slopes gradually from the east up to the summit of the rim, and drove them, unsuspecting, over the cliff. In the vicinity of Abert lake are found crude pictographs on rocks, rock foundations of dwellings of primitive people, arrowheads and skeletons.

Rhinoceros and camel fossil remains, and those of many other animals have been found nearby.

**ABERYSTWYTH** (ab-ur-ŭst'with), municipal borough, watering place and university town, in the Cardiganshire parlia-

mentary division, on the shores of Cardigan bay, Wales, at the mouth of the artificially united Rheidol and Ystwyth rivers. Pop (est. 1938) 9,309. Area, 1.78 sq.mi There appears to be a long tradition of settlement in the neighbourhood, for on a prominent hill (Pendinas) overlooking the south of the town is one of the largest hill-top earthworks in central Wales. With the clearing of the lowland, Pendinas was superseded by Llanbadarn Fawr, a village situated on a dry bend above the flood plain of the Rheidol about 1½ mi. E. of the town The existence of three Norman motte and bailey castles in the neighbourhood suggests loose military tenure in early Plantagenet times. The most interesting of these sites is Castell Aberystwyth situated above the bend of the Ystwyth about 1½ mi S. of the town. It gave its name to the Edwardian stone castle erected near the fishing village that grew up at the river mouths. The history of the castle was a troublesome one, as was to be expected from its position in the heart of Wales, but future developments centred in the little community that gathered beneath it, and not in Llanbadarn Fawr. Traces of the mediaeval town wall are still to be seen.

Aberystwyth shared in the mining (lead), agricultural and sea trade movements of the early 19th century and seems to have become at this time the social centre for the surrounding area. It has since extended northwards and eastwards over the newly drained marshy ground that surrounded the mediaeval settlement, and has gained favour as a summer health resort, especially since the development of the railway. The latter, however, killed the coastal trade and much of the seafaring habit; the harbour is now derelict (*see* CARDIGANSHIRE). As a link between the northern and southern parts of Welsh Wales, Aberystwyth became the site of the first University college of Wales, opened in 1872 and incorporated by charter in 1889, and of the National Library of Wales, opened in 1911. In 1906 the Welsh Calvinistic Methodist Theological college was moved here from Trevecca Aberystwyth, whose first charter was granted in 1277, was a contributory parliamentary borough until 1885. A town planning scheme is in operation.

**ABETTI, ANTONIO** (1846–1928), Italian astronomer, was born on June 19, 1846, at Gorizia, Italy He was educated at Pisa. After working in the observatories at Pisa and Padua, Abetti became director of the Arcetri observatory, Florence, in 1894; he remained there until he retired in 1921. He made a special study of the minor planets and wrote a number of papers on this subject. Abetti was a member of the Academie dei Lincei; he died on Feb. 20, 1928.

Abetti wrote *Construction of a Sundial in a Vertical Plane* (1876); *Differences in Longitude between Rome, Padua and Arcetri* (1891), *Annals of Arcetri Observatory* (1896–1911).

**ABETTOR,** a law term implying one who is present, actually or constructively, and aids and abets another to commit an offence. An abettor differs from an accessory (*q.v.*) in that he must be present at the commission of the crime; all abettors (with certain exceptions) are principals in the second degree, and, in the absence of specific statutory provision to the contrary, are punishable to the same extent as the actual perpetrator of the offence.

**ABEYANCE,** a state of expectancy in respect of property, titles or office, when the right to them is not vested in any ascertained one person, but awaits the appearance or determination of the true owner. In law, the term abeyance can only be applied to such future estates as have not yet vested or possibly may not vest. The freehold of a benefice, on the death of the incumbent, is said to be in abeyance until the next incumbent takes possession. A common use of the term is in the case of peerage dignities. If a peerage which passes to heirs-general, like the ancient baronies by writ, is held by a man whose heir-at-law is neither a male, nor a woman who is an only child, it goes into abeyance on his death between two or more sisters or their heirs, and is held by no one till the abeyance is terminated; if eventually only one person represents the claims of all the sisters, he or she can claim the termination of the abeyance as a matter of right. The Crown can also call the peerage out of abeyance at any moment, on petition, in favour of any one of the sisters or their heirs between whom it is in abeyance It is common, but incorrect, to speak of peerage dignities which are dormant (*i.e.*, unclaimed) as being in abeyance. (*See* PEERAGE)

**ABGAR,** a name borne by a line of Mesopotamian kings, 29 in number, who reigned in Osrhoene and had their capital at Edessa in the last century before and the first century after the birth of Christ According to an old tradition, one of these princes, perhaps Abgar V. (Ukkāmā or Uchomo, "the black"), being afflicted with leprosy, sent a letter to Jesus, acknowledging his divinity, craving his help and offering him an asylum in his own residence, but Jesus wrote a letter declining to go, promising, however, that after his ascension he would send one of his disciples. Eusebius states that in due course Judas, son of Thaddaeus, was sent (A.D. 29). The letters are given by Eusebius (*Eccl Hist.* i. 13), who declares that the Syriac document from which he translates them had been preserved in the archives at Edessa from the time of Abgar.

This legend has survived in various forms, and has given rise to much discussion The correspondence was rejected as apocryphal by Pope Gelasius and a Roman synod (*c.* 495), though, it is true, this view has not been shared universally by the Roman Church. Among Protestants the spuriousness of the letters is almost universally admitted. Lipsius (*Die Edessenische Abgarsage,* 1880) has pointed out anachronisms which seem to indicate that the story is quite unhistorical. The first king of Edessa of whom we have any trustworthy information is Abgar VIII bar Ma'nu (A.D. 176–213). It is suggested that the legend arose from a desire to trace the Christianizing of his kingdom to an apostolic source.

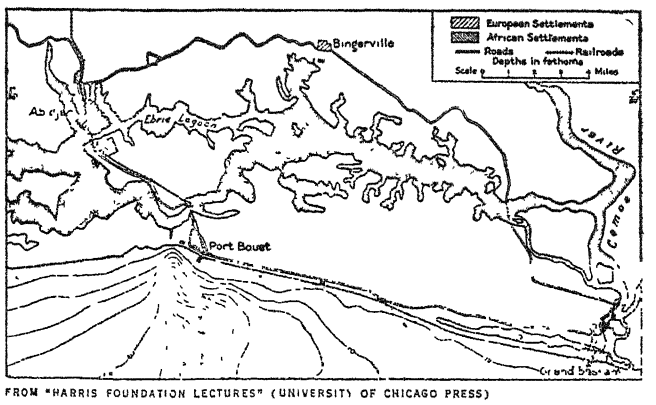
*See* Lipsius, *Die Edessenische Abgarsage kritisch untersucht* (1880); Tixeront, *Les Origines de l'église d'Edesse et la légende d'A.* (1888); for the Epistles *see* APOCRYPHAL LITERATURE, sect. "Epistles."

**ABGESANG:** *see* AUFGESANG.

**ABHIDHAMMA,** the name of one of the three divisions into which the Buddhist scriptures are divided (*see* BUDDHA AND BUDDHISM). It consists in the Pali Canon of seven works: 1. *Dhammasangani* (enumeration of mental states). 2. *Vibhanga* (analysis). 3. *Kathā-vatthu* (subjects of discussion). 4. *Puggala-paññatti* (on classes of individuals). 5. *Dhātu-kathā* (on mental elements). 6. *Yamaka* (pairs of ethical states). 7. *Paṭṭhāna* (relations of ethical states). These have been published by the Pali Text society, and the first, third and fourth have been translated (*see* below). Most of the works consist of the analysis and classification of psychical states from an ethical standpoint, but the *Kathā-vatthu* gives a list of dogmas disputed between the 18 sects. The Ceylon Chronicles say that it was spoken or promulgated (not composed) by Tissa Moggaliputta at the third council in 247 B.C. As Mrs. Rhys Davids has shown, it must have been compiled gradually. It is probably one of the latest of the works, but none of them are primitive, and some schools, according to Tāranātha, denied that Abhidhamma was the word of Buddha. The oldest name for this literature is *mātikā,* "lists," *i.e.* of the questions discussed, and it is mentioned under this name in several parts of the canon, but from this nothing can be inferred as to the age of the extant works. The Sarvāstivāda school had a similar set of seven works, which exist now only in a Chinese version. They have been analysed by Prof. Takakusu in the article mentioned below. The subject was first examined by Burnouf, who relied on the Mahāyāna canon as found in Tibetan, in which Abhidharma (Pāli, Abhidhamma) is represented by the *Prajñāpāramitā* and such works. These teach a doctrine of negativism, or as Prof. Stcherbatsky terms it, relativity, and hence Abhidharma was translated "metaphysics." But this is quite absent from the earlier schools, in which the term means "higher dharma."

See *Buddhist Psychology,* translation of *Dhamma-sangani,* and *Points of Controversy,* translation of *Kathā-vatthu,* by Mrs. Rhys Davids (1900 and 1915); E. Burnouf, *Introduction à l'histoire du bouddhisme indien* (1845); Tāranātha, *Geschichte des Buddhismus,* translated by A. Schiefner, St. Petersburg, 1869; "On the Abhidhamma books of the Sarvāstivādins," by Prof. Takakusu, in *Journal of the Pāli Text Society,* 1905; *Designation of human types,* translation of *Puggala-paññatti,* by B. C. Law (1924). (E. J. T.)

**ABHORRERS,** the name given in 1679 to the persons who expressed their "abhorrence" at the action of those who had signed petitions urging King Charles II to assemble parliament. Feeling against Roman Catholics, and especially against James, duke of York, was running strongly; the Exclusion bill had been passed by the house of commons, and the popularity of James, duke of Monmouth, was very great. To prevent this bill from passing into law, Charles had dissolved parliament in July 1679, and in the following October had prorogued its successor without allowing it to meet He was then deluged with petitions urging him to call it together, and this agitation was opposed by Sir George Jeffreys (*q v.*) and Francis Wythens, who presented addresses expressing "abhorrence" of the "Petitioners," and thus initiated the movement of the ABHORRERS, who supported the action of the king. "The frolic went all over England," said Roger North, and the addresses of the Abhorrers which reached the king from all parts of the country formed a counterblast to those of the Petitioners. It is said that the terms Whig and Tory were first applied to English political parties in consequence of this dispute. (*See* WHIG AND TORY.)



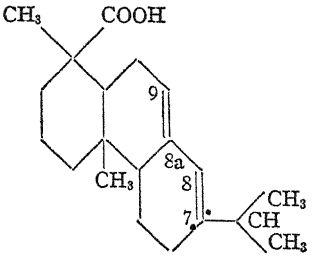
**ABIATHAR,** in the Old Testament, son of Ahimelech, priest of Nob. He alone escaped from the massacre carried out by Doeg. Fleeing to David, he remained with him throughout his wanderings and his reign. He was loyal through the rebellion of Absalom, but supported Adonijah against Solomon, and was banished to Anathoth. He probably represents an early rival house to that of Zadok, the official priestly family of Jerusalem down to the exile. (*See* especially I Sam. xxii, *seq.*, II Sam. xv, xx, I Ki i, ii, iv.)

**ABICH, OTTO WILHELM HERMANN VON** (1806–1886), German mineralogist, geologist and traveller, was born in Berlin on Dec. 11, 1806, and died in Vienna on July 1, 1886. His earliest scientific work related to spinels and other minerals, and later he made special studies of fumaroles, of the mineral deposits around volcanic vents and of the structure of volcanoes. The mineral abichite was named after him.

His works include: *Vues illustratives de quelques phénomènes géologiques, prises sur le Vésuve et l'Etna, pendant les années 1833 et 18[illegible]* (Berlin 1836); *Ueber die Natur und den Zusammenhang der [illegible] Bildungen* (Berlin 1841); *Geologische Forschungen in den Kaukasischen* [illegible] 1878, 1882 and 1887).

**ABIDJAN** (5° 27′ N., 4° W.), is the rising, government-fostered metropolis of Ivory Coast, French West Africa. Its pop. (17,500, official est. 1936) makes it the largest centre in the colony (8th in F.W.A.); in European inhabitants (1,060) it is materially outranked only by Dakar. It stands on a low promontory of the mainland shore of Ebrié lagoon, opposite a place where the sand bar that forms the coastline is narrow (875 yd.), and a submarine valley, the Bottomless Pit, brings deep water close to shore (*see* map).

The town dates from 1903, when it was made the terminus of a railroad penetrating the dense coastal forest. Subsequent extensions of the rails enhanced its commercial value, but for a generation want of port facilities prevented its growth. Attempts to maintain a canal through the bar in 1906–08 failed. In 1923 Ebrié lagoon was linked to its neighbour next west by a 7 mi. canal, making a waterway 125 mi. long navigable for small craft. Later the railroad was extended 7 mi. (via causeway and pontoon bridge across the lagoon) to an ocean terminal on the bar, Port Bouet. There a 1,350-ft. pier projecting beyond the breakers to expedite lighterage has been in use from 1931. This gives Abidjan wharf facilities equivalent to the original port of the vicinity—Grand Bassam, a typical *comptoir* set up about 1850 on the bar 22 mi. east, where the Comoe river brings down timber, an early and still important product In 1934 the capital of Ivory Coast colony was moved to Abidjan from Bingerville (on the mainland 9 mi. east), the remaining European station of the district. Combined advantages have promoted Abidjan's growth, partly at the expense of its neighbours. There remains at Bingerville an agricultural station, and at Grand Bassam the superior law court, besides some port business and the squaring of logs for export. World War II halted a project to cut the bar and build jetties immediately west of the Bottomless Pit, to permit ocean shipping to berth at Abidjan, where the lagoon is 45 ft. deep.



FROM "HARRIS FOUNDATION LECTURES" (UNIVERSITY OF CHICAGO PRESS)

The town plat covers the full width of its peninsular site, with government buildings and the commercial centre adjacent to the proposed port at the tip. Residences and miscellaneous services scatter on either side of the central thoroughfare, which leads to the main highway north. City lots ranged in blocks take the place of the traditional African compounds. Two residential suburbs for Africans are separated from the European town, one by the lagoon, the other by a wooded tract. All sections are serviced with electricity, and with water pumped from municipal wells sunk 60–80 ft. into a sandy substratum adequate for all presumptive needs. There are semiofficial chambers of commerce and agriculture, and a government hospital. Motor roads reach the near-by settlements, and two motorable routes penetrate the colony as part of the intercolonial highway system. (D. WH.)

**ABIETIC ACID.** The term abietic acid has been used indiscriminately to describe a number of resin-acid mixtures and, in some cases, purified naturally-occurring rosin. Abietic acid actually is a pure chemical compound with molecular formula $C_{20}H_{30}O_2$; it is a representative of the naturally-occurring resin acids with the same formula. These latter, in turn, are the major constituents of gum oleoresin, the exudate that flows from the trunks of conifers upon systematic scarification, and of the rosin (colophony) that is solvent-extracted from the aged stumps of pine trees. The name abietic acid was derived from the species of French pine, *Pinus abies,* from which the acid was first isolated (F. Schulz) in 1917. In the United States, however, the long leaf (*Pinus palustris*) and slash pines (*Pinus caribaea*) are the chief sources of rosin in which 30%–40% abietic acid is present.

The pure acid crystallizes from methanol, upon the addition of water, as triangular plates in the monoclinic system with a melting point of 171°–175° C., and an optical rotation of $[\alpha]_D^{24}-106°$ (of a 1% solution in absolute ethanol). It exhibits its most intense absorption band in the ultra-violet region at 241 mμ wave length. In characterizing resin acids, only the last two properties, optical rotation and ultra-violet absorption are used since the melting points of these substances are not indicative of degree of purity. The acid is soluble in all common organic solvents.

Abietic acid was shown (L. Ruzicka) to be a carboxylic acid derivative of trimethylisopropylhydrophenanthrene, which has the molecular formula $C_{20}H_{32}$. Absorption in the ultra-violet region at 241 mμ indicated the presence of a system of double bonds conjugated between two rings. Their positions were eventually proved (Louis F. Fieser, William P. Campbell, L. Ruzicka) to be those shown in the following formula.

Upon treatment of abietic acid with strong acids, an equilibrium mixture of isomeric acids is formed which contains approximately 85% of the original acid. If the free acid is heated at high temperatures, a similar effect is observed, although the final equilibrium achieved by this process does not have the same composition as that prepared by acid isomerization. Because of this tendency of abietic acid for isomerization and its tendency to undergo air oxidation, it must be kept out of contact with strong acids and air during reactions and while being held in storage.

The pure acid is isolated from rosin in the following manner: the rosin is first isomerized with mineral acid to increase the abietic acid content from 35% to 50%. An acetone solution of the isomerized rosin is treated with diamylamine to obtain the crystalline, insoluble salt of abietic acid which is recrystallized to the optimum rotation, $[\alpha]_D^{24}-60°$, and the pure acid with rotation $[\alpha]_D^{24}-106°$, isolated by decomposition of the salt with boric acid.

For determining the purity of a sample or the amount of abietic acid in a mixture, the ultra-violet absorption characteristics of the sample are compared with those of a pure reference sample.

Rosin, which contains 30%–40% of abietic acid, is composed of 90% of similarly constituted resin acids. It is one of the least expensive sources of organic acids available in large quantities and hence is used extensively to produce many commercial products of which the following are examples: the sodium soap of rosin and modified rosins find use in three large industries, in synthetic rubber production as an emulsifying agent, in paper-making for sizing and in soap manufacture. The heavy metal salts, prepared from the sodium salts, are used as driers for paints and varnishes, as hardening agents for rosin and as antifouling agents in paints. Monohydric and polyhydric alcohol esters of rosin are used extensively in the paint and varnish industry. Valuable resins with outstanding properties of light resistance and compatibility have been prepared by the addition of maleic anhydride to rosin followed by esterification with monohydric or polyhydric alcohols. Decarboxylated rosin, known as rosin oil, is used extensively in greases, rubber reclaiming, foundry core compounds, linoleums and shoe polishes. (G. C. HA.)

**ABIGAIL** (Heb. *Abigayil,* perhaps "father is joy"), or ABIGAL (II Sam. iii, 3), in the Bible, the wife of Nabal the Carmelite of southern Judah, on whose death she became one of the earlier wives of David (I Sam. xxv). By her David had a son, whose name appears in the Hebrew of II Sam. iii, 3 as Chileab, in the Septuagint as Daluyah and in I Chron. iii, 1 as Daniel. The name Abigail was also borne by a sister of David's (II Sam. xvii, 25; I Chron. ii, 16 *f.*). From the former (self-styled "handmaid" I Sam. xxv, 25 *f.*) is derived the 16th and 17th century colloquial use of the term for a waiting woman (*cf.* Abigail, the "waiting gentlewoman," in Francis Beaumont and John Fletcher's *The Scornful Lady*).

**ABIJAH** (Heb. *Abiyyah* and *Abiyyahu,* "Yah is father"), a name borne by nine different persons mentioned in the Old Testament, of whom the most noteworthy are the following. (1) The son and successor of Rehoboam, king of Judah (II Chron. xii, 16; xiii), reigned about two years (918–915 B.C.). The accounts of him in the books of Kings and Chronicles are very conflicting (compare I Kings xv, 2 and II Chron. xi, 20 with II Chron. xiii, 2). The Chronicler tells us that he has drawn his facts from the Midrash (commentary) of the prophet Iddo. This is perhaps sufficient to explain the character of the narrative. (2) The second son of Samuel (I Sam. viii, 2; I Chron. vi, 28 [13]). He and his brother Joel judged at Beersheba. Their misconduct was made by the elders of Israel a pretext for demanding a king (I Sam. viii, 4). (3) A son of Jeroboam I, king of Israel; he died young (I Kings xiv, 1 *ff.*, 17). (4) Head of the eighth order of priests (I Chron. xxiv, 10), the order to which Zacharias, the father of John the Baptist, belonged (Luke i, 5).

The alternative form ABIJAM is probably a mistake, though it was upheld by M. Jastrow.

**ABILA,** (1) generally called Abila of Pausanias to distinguish it from (2) below. It was the capital of the tetrarchy of Abilene in ancient Syria and an important town on the road between Damascus and Baalbek (Heliopolis). Ruins and inscriptions at the modern village of Sūq Wādī Baradā mark its site, which, though the names have no connection, is one of the traditional burial places of Abel. Early Arab geographers called it Ābil Al Sūq. According to Josephus, Abilene was a separate Iturean kingdom till A.D. 37, when Caligula granted it to Agrippa I; in 52 Claudius granted it to Agrippa II (*See* also LYSANIAS.) (2) A city of Perea (modern north Jordan) represented by ruins of Ābil Al Zait.

**ABILDGAARD, NIKOLAJ ABRAHAM** (1744–1809), Danish painter, was born at Copenhagen, the son of Sören Abildgaard, an antiquarian draughtsman of repute He formed his style on that of Claude Lorrain and of Nicolas Poussin, and was a cold theorist, inspired not by nature but by art. As a technical painter he attained remarkable success, his tone being very harmonious and even, but the effect, to a foreigner's eye, was rarely considered to be interesting.

His works were scarcely known outside of Copenhagen, where he won an immense fame in his own generation. He was the founder of the Danish school of painting, and the master of Bertel Thorwaldsen and Kristoffer Eckersberg

**ABILENE,** a city of Kansas, U.S., on the Smoky Hill river, about 95 mi. W. of Topeka; the county seat of Dickinson county. It is on federal highway 40, and is served by the Union Pacific, the Rock Island and the Santa Fe railways. The population was 5,580 in 1950, and 5,671 in 1940 by the federal census. In the 1860s Abilene, at the end of the trail from the southwest, was one of the important centres for shipping cattle. It has a large trade in cattle, grain and poultry, and is headquarters of the store company serving variety stores in Kansas and Colorado. Its creamery has an annual output valued at $2,000,000. Flour mills and bottling works for medicinal mineral water are also important. Abilene was settled about 1860; incorporated in 1869; and adopted the commission-manager form of government in 1939. The boyhood home of Gen. Dwight D. Eisenhower is open to the public.

**ABILENE,** a city of Texas, U.S., about 150 mi. W. by S. of Fort Worth, at an altitude of 1,738 ft., almost at the geographical centre of the state; the county seat of Taylor county. It is on federal highways 80 and 83, and is served by the Texas and Pacific, the Abilene and Southern and the Wichita Valley railways and by seven motor-stage lines and Pioneer Air Lines. Between 1900 and 1920 the population increased threefold, from 3,411 to 10,274; in 1940 it was 26,612; in 1950, 47,102.

Abilene is the distributing centre for a fine farming and stock-raising district. Around it are many producing petroleum pools. It has numerous wholesale concerns, and is headquarters for many oil companies and oil-well supply firms.

Natural gas is abundant. Cottonseed and peanut products, feeds, pressed brick, dairy products, clothing, oil-field equipment, candy and watches are manufactured. The assessed valuation of property in 1950 was $56,000,000. The West Texas fair is held there. Abilene is the seat of Hendrick Memorial hospital and St. Ann hospital. There are three denominational institutions of higher learning: McMurry college (Methodist), Abilene Christian college (Church of Christ) and Hardin-Simmons university (Baptist). The city has a council-manager form of government. Its site was determined by the route of the Texas and Pacific railway. When it was extended through that region, new towns sprang up as sections were completed; and at milepost 407, on March 16, 1881, the first sale of building lots was held for the city of Abilene.

**ABILITIES, GENERAL AND SPECIAL.** These (together with personality traits, attitudes and interests) constitute the principal subject matter of "differential psychology," which deals with individual differences in these mental functions, their nature, origin, determining conditions, development measurement, interrelations and distribution. C. Spearman wrote in earlier editions of the *Encyclopædia Britannica,* "The now common term 'general ability' in its current signification is of recent origin Previously it appears to have had only occasional usage in ordinary writing and conversation, being there taken to characterize excellence in performances of several different kinds; especially when

these were not all readily subsumable under the name of 'intelligence'." Recognition by psychologists and educators of different kinds and degrees of generality and specificity among abilities has gone forward along with the multiplication and refinement of psychological tests and with attempts to define the nature of the tested abilities more accurately, by methods of factor analysis and validation studies. (*See* DIFFERENTIAL PSYCHOLOGY; INTELLIGENCE; PSYCHOLOGICAL TESTS.) (F. A. K.)

**ABIMELECH** (Hebrew for "father of [*or* is] the king"), the name of two well-known characters in the Old Testament. (1) A king of Gerar in South Palestine with whom Isaac had relations The patriarch, during his sojourn there, alleged that his wife, Rebekah, was his sister; but the king, doubting this, remonstrated with him and pointed out how easily adultery might have been unintentionally committed (Gen. xxvi). Abimelech is called "king of the Philistines," but the title is clearly an anachronism A very similar story is told of Abraham and Sarah (ch. xx), but here Abimelech takes Sarah to wife, although he is warned by a divine vision before the crime is actually committed. The incident is fuller and shows a great advance in ideas of morality. Of a more primitive character, however, is another parallel story of Abraham at the court of Pharaoh, king of Egypt (xii, 10–20), where Sarah, Abraham's wife, is taken into the royal household, and the plagues sent by Yahweh lead to the discovery of the truth.

Further incidents in Isaac's life at Gerar are narrated in Gen. xxvi (*cf.* xxi, 22–34, time of Abraham), notably a covenant with Abimelech at Beersheba (whence the name is explained "well of the oath"). By a pure error, or perhaps through a confusion in the traditions, Achish the Philistine (of Gath, I Samuel xxi; xxvii), to whom David fled, is called Abimelech in the superscription to Psalm xxxiv.

(2) A son of Jerubbaal or Gideon (*q.v.*), by his Shechemite concubine (Judges viii, 31; ix). On the death of Gideon, Abimelech set himself to assert the authority which his father had earned, and through the influence of his mother's clan won over the citizens of Shechem. Furnished with money from the treasury of the temple of Baal-berith, he hired a band of followers and slew 70 (*cf.* II Kings x, 7) of his brethren at Ophrah, his father's home. This is one of the earliest recorded instances of a practice common enough on the accession of oriental despots. Abimelech thus became king, and extended his authority over central Palestine. But his success was short-lived, and the subsequent discord between Abimelech and the Shechemites was regarded as a just reward for his atrocious massacre. Jotham, the only one who is said to have escaped, boldly appeared on Mount Gerizim and denounced the ingratitude of the townsmen toward the legitimate sons of the man who had saved them from Midian "Jotham's fable" of the trees who desired a king may be foreign to the context; it is a piece of popular lore, and cannot be pressed too far: the nobler trees have no wish to rule over others, only the bramble is self-confident. The "fable" appears to be antagonistic to ideas of monarchy. The origin of the conflicts which subsequently arose is not clear. Gaal, a newcomer, took the opportunity at the time of the vintage, when there was a festival in the temple, to head a revolt and seized Shechem. Abimelech, warned by his deputy Zebul, left his residence at Arumah and approached the city. In a fine bit of realism we are told how Gaal observed the approaching foe and was told by Zebul, "Thou seest the shadow of the mountains as if they were men," and as they drew nearer Zebul's ironical remark became a taunt, "Where is now thy mouth wherewith thou saidst, who is Abimelech, that we should serve him? Is not this the people that thou hadst despised? Go out, I pray now, and fight with them." This revolt, which Abimelech successfully quelled, appears to be only an isolated episode. Another account tells of marauding bands of Shechemites which disturbed the district. The king disposed his men (the whole chapter is specially interesting for the full details it gives of the nature of ancient military operations), and after totally destroying Shechem, proceeded against Thebez, which had also revolted. There, while storming the citadel, he was struck on the head by a fragment of a millstone thrown from the wall by a woman. To avoid the disgrace of perishing by a woman's hand, he begged his armour-bearer to run him through the body, but his memory was not saved from the ignominy he dreaded (II Sam xi, 21) It is usual to regard Abimelech's reign as the first attempt to establish a monarchy in Israel, but the story is mainly that of the rivalries of a half-developed petty state, and of the ingratitude of a community toward the descendants of its deliverer.

ABINGDON, municipal borough, Berkshire, lying in the flat Thames valley on the Oxford border, where the small river Ock, draining the Vale of White Horse, joins the Thames. Pop. (1938) 7,989 Abingdon (Abbedun, Abendun) was famous for its abbey, which was of great wealth and importance, and is believed to have been founded in A.D. 675 by Cissa, one of the *subreguli* of Centwin. Abundant charters from early Saxon monarchs are extant confirming various laws and privileges to the abbey, and the earliest of these, from King Ceadwalla, was granted before A.D. 688 In the reign of Alfred the abbey was destroyed by the Danes, but it was restored by Edred, and an imposing list of possessions in the Domesday survey evidences recovered prosperity. William the Conqueror in 1084 celebrated Easter at Abingdon, and left his son, afterward Henry I, to be educated at the abbey. After the dissolution in 1538, the town sank into decay, and in 1555, on a representation of its pitiable condition, Queen Mary granted a charter establishing it as a free borough corporate with a common council The council was empowered to elect one burgess to parliament, and this right continued until the Redistribution of Seats act of 1885. The abbot seems to have held a market from very early times, and charters for the holding of markets and fairs were granted by various sovereigns from Edward I to George II. In the 13th and 14th centuries Abingdon was a flourishing agricultural centre with an extensive trade in wool, and a famous weaving and clothing manufacture The latter industry declined before the reign of Queen Mary, but has since been revived.

Remains of the Benedictine abbey include a beautiful Perpendicular gateway, ruins of buildings called the prior's house, and the guest house. The narrow arched bridge over the Thames dates from 1416, and was doubtless an important feature in the town's growth. Near the bridge is St. Helen's church, the fine Early English tower and Perpendicular spire of which are the principal objects in the views of the town from the river. There may be mentioned further the old buildings of the grammar school (1563) and of the charity called Christ's Hospital (1583) and the town hall, attributed to Inigo Jones.

A popular Thames-side holiday resort, Abingdon also has manufactures of clothing and carpets and a large agricultural trade. The borough is under a mayor, 4 aldermen and 12 councillors. Area 2.6 sq.mi.

For purposes of parliamentary representation Abingdon is included in the Abingdon county division.

ABINGER, **JAMES SCARLETT,** 1ST BARON (1769–1844), English judge, was born on Dec. 13, 1769, in Jamaica, where his father, Robert Scarlett, had property. In the summer of 1785 he was sent to England to complete his education, and went to Trinity college, Cambridge, taking his B.A. degree in 1789. Having entered the Inner Temple, he was called to the bar in 1791, and joined the northern circuit and the Lancashire sessions. Though he had no professional connections, by steady application he gradually obtained a large practice, ultimately confining himself to the Court of King's Bench and the northern circuit. He took silk in 1816, and from this time till the close of 1834 he was the most successful lawyer at the bar; he was particularly effective before a jury, and his income reached the high-water mark of £18,500, a large sum for that period. He began life as a Whig, and first entered parliament in 1819 as member for Peterborough, representing that constituency with a short break (1822–23) until 1830, when he was elected for the borough of Malton. He became attorney general, and was knighted when George Canning formed his ministry in 1827; and though he resigned when the duke of Wellington came into power in 1828, he resumed office in 1829 and went out with the duke of Wellington in 1830. His opposition to the Reform bill caused his severance from the Whig leaders and, having joined the Tories, he was elected, first for Colchester and

then in 1832 for Norwich, for which borough he sat until the dissolution of parliament. Appointed lord chief baron of the exchequer in 1834 he presided in that court for more than nine years.

While attending the Norfolk circuit on April 2, he was suddenly seized with apoplexy, and died in his lodgings at Bury St. Edmunds on April 7, 1844. He had been raised to the peerage as Baron Abinger in 1835, taking his title from the Surrey estate he had bought in 1813.

The qualities which brought him success at the bar were not equally in place on the bench; he was partial, dictatorial and vain; and complaint was made of his domineering attitude toward juries. But his acuteness of mind and clearness of expression remained to the end. Lord Abinger was twice married (the second time only six months before his death), and by his first wife (d 1829) had three sons and two daughters, the title passing to his eldest son, Robert (1794–1861). His second son was Gen. Sir James Yorke Scarlett (*q.v.*), leader of the heavy cavalry charge at Balaclava; his elder daughter, Mary, married John, Baron Campbell, and was herself created Baroness Stratheden (Lady Stratheden and Campbell) (d. 1860). Sir Philip Anglin Scarlett (d. 1831), Lord Abinger's younger brother, was chief justice of Jamaica.

*See* P. C. Scarlett, *Memoir of James, 1st Lord Abinger* (1877); Foss, *Lives of the Judges;* E. Manson, *Builders of our Law* (1904).

**ABINGTON, FRANCES** (1737–1815), English actress, was the daughter of a private soldier named Barton, and was, at first, a flower girl and a street singer. She then became servant to a French milliner, obtaining a taste in dress and a knowledge of French which afterward stood her in good stead. Her first appearance on the stage was at the Haymarket in 1755 as Miranda in Susanna Centlivre's *The Busy Body*. In 1756, on the recommendation of Samuel Foote, she became a member of the Drury Lane company, where she was overshadowed by Hannah Pritchard and Kitty Clive. In 1759, after an unhappy marriage with her music-master, one of the royal trumpeters, she is mentioned in the bills as Mrs. Abington.

Her first remarkable success was in Ireland as Lady Townley, and it was only after five years, on the pressing invitation of David Garrick, that she returned to Drury Lane. There she remained for 18 years, and created more than 30 important characters, notably Lady Teazle (1777). Her Beatrice, Portia, Desdemona and Ophelia were no less liked than her Miss Hoyden, Biddy Tipkin, Lucy Lockit and Miss Prue.

It was in the last character in *Love for Love* that Sir Joshua Reynolds painted his best portrait of her.

In 1782 she left Drury Lane for Covent Garden. After an absence from the stage from 1790 until 1797, she reappeared, quitting it finally in 1799. Her ambition, personal wit and cleverness won her a distinguished position in society, in spite of her humble origin. Women of fashion copied her frocks, and a headdress she wore was widely adopted and known as the "Abington cap." She died on March 4, 1815.

**ABINGTON,** a town of Plymouth county, Mass., U.S.A., 19 mi. S. by E. of Boston. It is served by the New York, New Haven and Hartford railroad. The population was 7,133 in 1950 and 5,708 in 1940 by the federal census. Farming, fruit growing (especially strawberries), and dairying are carried on. The principal manufactures are boots and shoes, lasts, cement blocks, window-shades and machinery. The town was settled about 1680 and incorporated in 1712.

**ABINGTON,** a township of Montgomery county in eastern Pennsylvania, with an altitude of 300 ft. It is about 5 mi. N. of Philadelphia, of which it is a suburb, and is on U.S. highway 611. Population was 28,738 in 1950, and 20,857 by the census of 1940.

It was founded in 1714, the same year in which the Abington Presbyterian church was founded. It is ruled by a mayor-council form of government, with councilmen chosen in partisan elections and the mayor selected by the governing body. The town's sewage treatment plant is publicly owned. Abington is a banking town and has its own post office and hospital. The Abington Memorial hospital was established in 1914 and is a general, short-term hospital operated as a nonprofit corporation and accredited by the American College of Surgeons.

**ABIOGENESIS,** in biology, the term, equivalent to the older terms "spontaneous generation," *Generatio aequivoca, Generatio primaria,* and more recent terms such as archegenesis and archebiosis, for the theory according to which fully formed living organisms sometimes arise from non-living matter. Aristotle explicitly taught abiogenesis, and laid it down as an observed fact that some animals spring from putrid matter, that plant-lice arise from the dew falling on plants, etc., and most of the earlier biologists accepted his views. The first step in the scientific refutation of the theory of abiogenesis was taken by the Italian Redi, who, in 1668, proved that no maggots were "bred" in meat on which flies were prevented by wire screens from laying their eggs. From the 17th century onwards it was gradually shown that, at least in the case of all the higher and organisms, abiogenesis did not occur, but that *omne vivum e vivo,* every living thing came from a pre-existing living thing.

The discovery of the microscope carried the refutation further. In 1683 A. van Leeuwenhoek discovered bacteria, and it was soon found that however carefully organic matter might be protected by screens, or by being placed in stoppered receptacles, putrefaction set in, and was invariably accompanied by the appearance of myriads of bacteria and other low organisms As knowledge of microscopic forms of life increased, so the apparent possibilities of abiogenesis increased, and it became a tempting hypothesis that whilst the higher forms of life arose only by generation from their kind, there was a perpetual abiogenetic fount by which the first steps in the evolution of living organisms continued to arise, under suitable conditions, from inorganic matter. It was due chiefly to L. Pasteur that the occurrence of abiogenesis in the microscopic world was disproved. If organic matter were first sterilized and then prevented from contamination from without, putrefaction did not occur, and the matter remained free from microbes. The nature of sterilization, and the difficulties in securing it, as well as the extreme delicacy of the manipulations necessary, made it possible for a very long time to be doubtful as to the application of the phrase *omne vivum e vivo* to the microscopic world, and there still remain a few belated supporters of abiogenesis. It may now be stated definitely that all known living organisms arise only from pre-existing living organisms. It must be noted, however, that this statement relates only to known existing organisms. It may be that in the progress of science it may yet become possible to construct living protoplasm from non-living material. The refutation of abiogenesis has no further bearing on this possibility than to make it probable that if protoplasm ultimately be formed in the laboratory, it will be by a series of stages, the earlier steps being the formation of some substance, or substances, now unknown, which are not protoplasm. Such intermediate stages may have existed in the past, and the modern refutation of abiogenesis has no application to the possibility of these having been formed from inorganic matters at some past time. Perhaps the words archebiosis, or archegenesis, should be reserved for the theory that protoplasm in the remote past has developed from non-living matter by a series of steps, and many of those, notably T. H. Huxley, who took a large share in the process of refuting contemporary abiogenesis, have stated their belief in a primordial archebiosis. (*See* BIOGENESIS; BIOLOGY.)

**ABIPONES,** a tribe of South American Indians belonging to the Guaycuruan (*q.v.*) linguistic stock. The Abipones were a warlike, nomad hunting people, living in the Argentine Chaco, between the Vermejo and Salado rivers. Although once numerous, they are now believed to be quite extinct. Both men and women wore mantles of coarse textiles, belted at the waist; the women were abundantly tattooed, the men but slightly. The latter wore long, pendant labrets. Their dwellings were tents of mats. Spears, bows, clubs, slings and bolas were their weapons. They had no shield, but used a poncho of heavy hide for protection. They made no use of canoes, having only "bull-boats" of hide stretched over a bowl-shaped frame, for crossing broad streams. Pottery was made. The people were divided into local social units, over which a semi-hereditary chief presided, although he had little power. The bodies of the dead were buried, unless death occurred far from home, when the flesh was stripped from the bones, and

these placed in a leather sack. This was carried with the roving group, until they reached their home, where it was buried. The [illegible] tent of the deceased were burned. Little is known of . beliefs and ceremonial. They possessed, however, some sort of secret societies, membership in which was attained by valour, and which celebrated ceremonials of importance.

The Abipones became widely known from the account of them written by the missionary Dobrizhofer, at the end of the 18th century, after they had become horse Indians.

*See* M. Dobrizhoffer, *An Account of the Abipones,* etc. (1822).

**ABITIBI,** lake and river, Ontario, Canada. The lake, 49° N. 80° W., 60 mi. long, is shallow and studded with islands; the shores are covered with small timber. The Hudson's Bay Co used it on a canoe route to the northern fur lands. The Grand Trunk Pacific (now the Canadian National) railway passes through this district. Its outlet is the rapid Abitibi river, which after 200 mi. joins the Moose river.

**ABJURATION,** a solemn repudiation or renunciation on oath. At common law, it signified the oath of a person who had taken sanctuary to leave the realm forever; this was abolished in the reign of James I. The *Oath of Abjuration* in English history, was a solemn disclaimer, taken by members of [illegible] and laymen against the right of the Stuarts to the [illegible] laws of William III, George I and George III; but its place has since been taken by the Oath of Allegiance.

**ABKHAZIA** (Abkhasia) (Georgian *Apkhazeti,* Abkhaz *Apsne*) A.S.S.R. under protection of Georgian S.S.R. comprising six districts of the former Sukhum province. Area 3,155 sq mi. Pop. (1939) 259,100. Its boundaries are, on the N., the North Caucasian area and Karachaev autonomous area, on the S. and E., the Georgian S.S.R.; on the W., the Black sea. It is divided into the following districts for administrative purposes; population in parentheses. Gagrinsk (9,950; urban 3,659, rural 6,291), Galsk (50,071, entirely rural), Gydaytsk (30,740; urban 3,536, rural 27,204), Kodoisk (33,043, urban 3,390, rural 29,653) and Sukhum (75,371; urban 20,032, rural 55,339). The area is mainly mountainous and densely forested (especially oak and walnut). The Black sea coastal belt from Sukhum-Kaleh southwards is an evergreen vegetation area with citrus fruits (oranges, mandarins, lemons), camellias and even palms. It has hot, sunny summers and winter rains of the western coast Mediterranean type, but in winter low-pressure systems form on the Black sea, with south and southeast [illegible] ain. Average temperature at Sukhum-Kaleh is in January [illegible] August 76.1° F. Oranges ripen in December and spring begins in February. The area is never frozen, and snow rarely falls and never lies; malaria is a perpetual scourge. The chief products are tobacco and maize, with wheat, grapes, figs, pomegranates, [illegible] and wine (vines hang from walnut trees). Tea and mulberries (for silk) are produced. On higher land, cattle and horses are bred and bees kept. The chief town is Sukhum-Kaleh on the Black sea coast (site of ancient Greek Dioskurias). Pop. 28,136. The town is noted for manufacture of saddlery. Other coastal towns are Pitsunda and Ochemchiri. There is a coastal railway. There are extensive coal deposits, practically unworked. Abkhazia, a former Georgian principality, was the home of the Abkhaz (Apkhaz) tribe (in Abkhaz *Apsua,* in Greek *Abasgoi*). A part of the Roman empire, it became Christian under Justinian (*c.* 550). In the 8th century, Leo, duke (*Eristavi*) of the Abasgi conquered western Georgia or Lazica and set up the mediaeval kingdom of Abasgia, independent of the Byzantine empire and later a part of the Georgian state (*see* Georgia). The duchy of Abkhazia itself became by 1184 a fief of the house of Sharvashidze, under which it acquired, after 1463, its independence from the Georgian crown. Ottoman suzerainty was imposed on Abkhazia in the 16th century and Mohammedanism supplanted Christianity. In 1810, George I Sharvashidze, prince of Abkhazia signed a treaty of protectorate with Russia. In 1840 the principality of Samurzaqano, under a branch of the Sharvashidzes, was annexed by Russia, and in 1864 Russia annexed Abkhazia itself. The country proclaimed its autonomy in 1919, and became an A.S.S.R. in 1921. The people are of Circassian stock, whose language belongs to the Abkhazo-Adigean group of the North Caucasian branch of the Japhetite languages. There are both tall and fair groups, and short, dark groups, with Tatar intermixture.

Bibliography.—Ashkhatsova, *The Ways of the Development of Abkhazian History* (1925); Bassaria, *Abkhazia from the Point of View of Geography, Ethnography and Economics* (1923), both in Russian; I. Javakhishvili, *The History of the Georgian People* (1913 ff.), in Georgian.

**ABLATION,** the process of removing anything; a term used technically in geology of the wearing away of a rock or glacier by weathering agents, and in surgery for operative removal.

**ABLATIVE,** in grammar, a case of the noun, the fundamental sense of which is direction from; in Latin extended to the instrument or agent of an act, and the place or time at, and manner in, which a thing is done; also found in Sanskrit, Zend, Oscan, Umbrian and other languages. (Lat. *ablativus,* sc. *casus,* from *ablatum,* taken away.) The "ablative absolute," in Latin, consists of a noun in the ablative case, with a participle or qualifying word agreeing with it, not depending on any other part of the sentence, to express the time, occasion or circumstance of a fact.

**ABLUTION,** a ritual washing destined to secure that ceremonial purity which must not be confused with the physical cleanliness obtained by the use of soap and water. (Lat. *abluo,* from *abluere,* "to wash off.") Indeed the two states may conflict, as with the 4th century pilgrim who boasted that she had not washed her face for 18 years for fear of removing the baptismal chrism. In the Catholic Church the *ablution* is the ritual washing of the chalice and of the priest's fingers after celebrating mass; or the wine and water used for this purpose. The purport of ablutions is to remove the supposed stains contracted by contact with the dead, with childbirth, menstruous women, murder, almost any form of bloodshed, persons of inferior caste, dead animal refuse, leprosy, madness and disease. In general, water, cows' urine and blood of swine are the materials used in ablutions. Of these water is the commonest, and its efficacy is enhanced if it be running, and still more if a magical or sacramental virtue has been imparted to it by ritual blessing or consecration. In the *Atharva-Veda,* vii. 116, a remedy for fever is to tie to the foot of the bed a frog, bound with red and black thread, and wash down the patient so that the water of ablution falls on the frog, the magician praying that the fever may pass into the frog, which is forthwith released. In the old Athenian Anthesteria the blood of victims was poured over the unclean. A bath of bulls' blood was used as a baptism in the mysteries of Attis. The water must in ritual washings run off in order to carry away the miasma or unseen demon of disease; so the early Christians used living or running water, which the baptizer must pour over the head of the baptized person so that it runs down his body. Similarly the Brahman takes care to wipe the cathartic water off from head to feet downwards, that the malign influence may pass out through the feet. The same care is shown in ritual ablutions in the Bukovina and elsewhere.

Water, fire, spices and sulphur are used in ritual cleansings (Iamblichus on Mysteries, v. 23), as being specially full of the divine nature. But in all religions the cathartic virtue of water is enhanced by means of suitable prayers and incantations. Ablutions are usually cathartic, that is, intended to purge away evil influences (*καθαίρειν,* to make *καθαρός,* pure). But things and persons may become taboo, that is, so holy as to be dangerous and useless for daily life, through the mere infection of holiness. Thus in Syria one who touched a dove became taboo for one whole day, and if a drop of blood of the Hebrew sin-offering fell on a garment it had to be ritually washed off. It was as necessary for the Hebrew priest to wash his hands *after* handling the sacred volume as before. Christians might not enter a church to pray without first washing their hands. Tertullian (*c.* 200) condemned this as a heathen custom; but it was insisted on in later ages (Sozomen, vi. 6) and is a survival of the pagan lustrations or *περιῤῥαντήρια.* The same custom prevails among Mohammedans. Porphyry (*de Abst.* ii. 44) relates that one who touched a sacrifice meant to avert divine anger must bathe and wash his clothes in running water before returning to his city and home, and similar scruples in regard to holy objects and persons have been observed among the natives of Polynesia, New Zealand and ancient Egypt.

**ABNAKI,** a group of closely related and confederate Algonkin Indian tribes originally centring in Maine, now mainly in Quebec and New Brunswick. The name means "east land." They included the Etchimin, Malecite, Passamaquoddy and Penobscot, often reckoned as distinct tribes. They fought the English colo-

nists, were friendly with the French, and in the 18th century most of the bands withdrew to French Canadian soil. They grew maize, hunted and fished, lived in conical houses of bark or mats, palisaded their villages, were divided into patrilineal totemic clans and were typical northern woodland tribes. Their speech is close to the Algonkin dialects of the Great Lakes. About 2,000 survive.

**ABNER.** In the Old Testament, Saul's cousin and commander in chief, comes into prominence only after the crushing defeat of Israel at Mt. Gilboa. This battle placed the Philistines in control of the whole of central Palestine, and the weakness of Israel was enhanced by the division into two parties, that of the south, which followed David, and that of Trans-Jordan, which remained faithful to Ishbaal, the son who succeeded Saul. The king himself, however, was a weak character, and the whole strength of the party was concentrated in Abner. The struggle between the two parties was continuous, and in the battle of Gibeon Abner killed Asahel, brother of Joab, thus exposing himself to the blood-vengeance of the dead man's whole family. It seems that Abner aspired to become the sole leader of his party and, as a step in the achievement of his aim, married Rizpah, one of the concubines of Saul For this he was reproved by Ishbaal, and thereupon deserted to the opposite party An agreement was made between David and Abner, by which David had restored to him Michal, daughter of Saul, thus establishing a claim on Saul's throne, and Abner was received into favour. Joab, however, in obedience to the binding law of blood-revenge, took an opportunity of putting Abner to death, and his disappearance practically brought to an end the resistance of the eastern party. David, of course, was not implicated in Abner's death, though he had no right to punish the assassin, and his short dirge over the body, like that over Saul and Jonathan, is an exquisite specimen of the early poetry of Israel. (*See* II Sam., ii, 8; iii, 39)

**ABNEY, SIR WILLIAM DE WIVELESLIE** (1843–1920). English chemist, was born at Derby, July 24, 1843, and died at Folkestone on Dec 3, 1920. Abney held high appointments at the board of education and was president at different times of the Royal Astronomical society and the Physical society. His contribution to science was mainly in the furtherance of photographic chemistry and especially of colour photography and colour printing. His publications on these subjects include *Instruction in Photography* (1870), *Colour Vision, Colour Measurement and Mixture* (1893) and *Trichromatic Theory of Colour* (1914). He also wrote *Thebes and Its Five Great Temples* (1876) and, with C. D. Cunningham, *The Pioneers of the Alps* (1888).

**ABNORMALITIES AND DEFORMITIES:** *see* MONSTER.

**ABNORMAL PSYCHOLOGY.** Psychology is the study of behaviour, and abnormal psychology is the study of deviations from normal behaviour. This definition at once raises the fundamental question: what do we mean by normal, and how are we to recognize deviations from it? The average naive person tends to consider himself as the measure of normality, and to regard as signs of abnormality all attitudes and responses in other persons that differ markedly from his own. Such a criterion, however reasonable it may seem to the individual employing it, has actually no value as a general principle. For one thing, it begins by assuming that each person is the sole judge of his own conduct, and for another, it implies that everyone is at all times normal.

An alternative to the naïve, individualistic approach is obviously that of judging each person's conduct in relation to the conduct of others in his culture who are of the same sex and belong to a similar age group To carry out this procedure we should have, ideally, a system of well-defined, established norms with which any given behaviour sample might then be compared, and its conformity with or deviation from them determined. There are, however, formidable obstacles to the construction and use of rigidly specified behaviour norms. The most serious of these are: (1) the heterogeneous composition of our contemporary industrial society, (2) the greatly increased mobility of individuals and groups, which inevitably increases the incidence of cultural conflict and (3) the relatively rapid changes in accepted standards of behaviour which have appeared within the past few generations.

These difficulties, and the existing limitations in available data and techniques in abnormal psychology, compel us for the time being to work with rough approximations, and to let the evolution of stricter definition wait upon the outcome of further exact investigation and controlled experiment. From this standpoint, the most useful criterion of normality we have is that of the relative adequacy of an individual's performance, in comparison with the behaviour to be expected of other persons sharing his status in his society. Such a criterion begins, not with the fiction of the perfect or ideal personality, but with the fact of a relatively wide range of culturally acceptable behaviour. It permits us to include as normal the many trivial oddities and irregularities, the little unexpected and unpredicted developments that can be found in the everyday reactions of ordinary persons.

**Relationship between Normal and Abnormal.**—From ancient times down to the present there have been two diametrically opposed views with regard to this important problem According to one, there is a clean break, a chasm, between normal and abnormal The normal person, it is contended, cannot possibly put himself in the place of abnormal persons and see things from their perspectives According to the other view, there is unbroken continuity between normal and abnormal (principle of continuity). That is, the normal shades imperceptibly into the abnormal, and both share a borderland in which normality and abnormality cannot with certainty be distinguished.

The absolutist tradition, which sharply divides abnormal from normal behaviour, finds popular expression in such statements as that a person is out of his head, has lost his reason or his mind, and therefore needs an alienist; *i.e.*, a specialist who deals with the mentally estranged. Most 19th-century alienists and nerve specialists, the predecessors of modern psychiatrists accepted this hypothesis of discontinuity as fact They tried to give substance to their speculations by postulating hypothetical brain and nerve changes in their patients to parallel the behaviour deviations which they observed. Early in the 20th century it was demonstrated conclusively that general paresis is the result of a specific brain infection. This raised the hope among absolutists that some day all neuroses and psychoses might prove to be no more than diseases of the brain. Their hope during the intervening four decades failed to materialize Indeed, as data have accumulated concerning general paresis itself, the conclusion has been reached in recent years that whatever behaviour disorder develops in general paresis depends for its character, not upon the specific infection, but upon the preparetic personality traits of the individual patient.

The relativist tradition, which maintains that there is continuity between normal and abnormal behaviour, did not become dominant in behaviour pathology until the 20th century. The position of the relativists was greatly strengthened by the growing realization, late in the 18th century and throughout the 19th, that abnormal phenomena could be deliberately induced for a short time in normal persons. Credit for arousing widespread interest in this fact belongs to Friedrich Anton Mesmer, the great hypnotist, who reached the height of his fame toward the end of the 18th century. It was his work that stimulated later investigators to make use of hypnosis therapeutically; and it was this therapeutic use which, in the latter half of the 19th century, led to the historically crucial feud between Parisian physicians, led by Jean Charcot, and Nancy physicians, led by Hippolyte Bernheim and Ambroise-Auguste Liébault.

**Rise of Modern Behaviour Pathology.**—The Paris-Nancy feud arose over differences concerning the relationship between hypnosis and hysteria. The Parisian group maintained that only the potentially hysterical could be hypnotized successfully; the Nancy group insisted that anyone could be. Each side was partly right, since we now know that nearly every adult

can be hypnotized and that most hysterical symptoms can be hypnotically induced in normal persons However, by far the most important outcome of the celebrated quarrel was a greatly increased interest in the origins and characteristics of psychopathology, or behaviour pathology. Two of the men who came directly under Charcot's influence during the last quarter of the 19th century became themselves internationally famous as behaviour pathologists Pierre Janet, who ultimately succeeded Charcot at Paris, began his long series of contributions to abnormal psychology with the publication of *L'Automatisme psychologique* in 1889 and *L'Etat mental des hystériques* in 1893. Sigmund Freud was a contemporary of Janet in Charcot's clinic during 1885; but he also visited Bernheim in Nancy for a few months in 1889. He translated the writings of both Charcot and Bernheim into German Freud's first papers on behaviour pathology, published in 1893 and 1895, were on the mechanisms of hysteria and show the effects of these early contacts.

No one else in recent times has influenced the development of abnormal psychology as profoundly as has Sigmund Freud Those who attack him on methodological grounds are likely to find themselves corroborating, through the use of their more sophisticated procedures, some of the fundamental tenets which Freud succeeded in deriving from simple observation Those who reject his hypotheses because they are phrased in the language of 19th-century psychosomatic dualism, discover that his most important constructs can be reformulated in modern biosocial terms without losing in usefulness. Indeed, one of the principal tasks confronting abnormal psychology in the mid-20th century was that of following up the leads indicated by the pioneer work of Freud and the psychoanalysts, with the aid of modern techniques and modern hypotheses.

## NEED AND SATISFACTION

The deviations with which abnormal psychology deals are often referred to as personality disorders. They are primarily disturbances in an individual's acquired systems of behaviour which define his social personality and upon which his interpersonal relationships depend. Consequently, in all discussions of behaviour pathology the social and cultural aspects of human living receive strong emphasis This does not mean, however, that we can neglect the biological aspects. Personality and its abnormal developments must always be studied as the products of a lifetime of interaction between a human organism and the environment by means of which it lives. It is through this interaction that each person learns to satisfy biological needs within the framework supplied by the social organization around him; and it is through the same interaction that each of us acquires innumerable new biosocial needs and satisfactions

By need we mean a condition of unstable or disturbed equilibrium in an organism's behaviour. This appears typically in the form of increased or protracted activity and tension. Need is characteristic of all ongoing activity sequences, whether these are overt or covert. It may result directly from some alteration in the relationship between organism and environment, as in sharp changes of temperature, or as the direct outcome of metabolic processes within the organism itself, as in hunger and thirst. In human beings, need commonly arises also as the more indirect result of symbolic behaviour, such as talking, reading or thinking.

The termination of need we call satisfaction. When this results directly from the increased activity incident to a need, as when eating or drinking restores the hungry organism's equilibrium, we speak of direct satisfaction. When a specific need is terminated through a mere shift in activity, through the distraction furnished by new stimulation, or by means of some learned substitution, we speak of indirect or substitute satisfaction. Under the conditions of human group living, with its compromises, its arbitrary rules and its cultural traditions, the indirect or substitute satisfactions take on great significance, and particularly so in the development and persistence of ab-

Unsatisfied need is an important factor in behaviour from the moment of birth. To be born is to be separated from the automatic machinery of satisfaction which life in the mother's uterus provides, and to be left for the first time dependent upon the convenience and good will of someone else. The newborn infant is thus introduced to his first frustrations in the form of delay between the appearance of need and its satisfaction It is largely through his dependence upon older persons that the human infant and child is gradually inducted into the customs of the society into which he is born. His parents or parent-substitutes originally control all the means of a small child's satisfactions; and they relinquish control only as the child shows the ability to conform to social regulations in his patterns of need and satisfaction In other words, the human being's inability early in life to satisfy his needs unaided constitutes one of the most important conditions for his progressive socialization.

The child receives his earliest lessons in distinguishing right from wrong when he learns the simple regulations which his society has set up in relation to eating, drinking and elimination, to body care and cleanliness and the taboos against erotic interest These early acquired distinctions between that which his elders reward, as right, and that which they punish, as wrong, have been called visceral ethics; *i.e.*, ethical attitudes derived from learning the social control of visceral functions. Chiefly through the influence of psychoanalytic schools of thought, modern behaviour pathology has come to place considerable emphasis upon the importance of visceral ethics. This emphasis, in turn, has thrown much light upon the striking confusions that one encounters clinically between goodness or badness and questions of food or fluid intake, elimination, sex functions, cleanliness and body care Some of the more common confusions of this kind are to be found in compulsive handwashing, in hypochondriacal attitudes toward gastrointestinal functions, in complaints of impotence and frigidity based upon guilt and aversion, in hysterical loss of appetite and in delusions of body change

**Hunger and Thirst.**—As simple biological needs, which require no more than food and fluid intake for their satisfaction, hunger and thirst are seldom significant in abnormal psychology. However, in western society the normal satisfaction of hunger and thirst takes place under conditions that inevitably lead to important interpersonal relationships. Infant and child feeding, for example, involves intimate contact and personal interaction between mother and offspring. In this relationship are laid down some of the most fundamental patterns of social acceptance, approval and affection Throughout childhood and adolescence, feeding continues to be an effective means of socialization. Banishment from the family table and the withholding of food are common types of punishment for nonconformity. Extra helpings and special foods are frequently used as rewards for pleasing behaviour or as consolation for other losses and for sacrifices. Moreover, the relationship of eating to health, strength, growth, good looks and biological maturing is repeatedly pointed out to child and adolescent at the family table.

If we are to understand some of the remarkable confusions met with in behaviour pathology, it is essential to realize that eating and drinking are by no means confined to the satisfaction of hunger and thirst, or even to social acceptance and approval within the family circle. We normally eat and drink in celebrating success, in sealing agreements, in mourning our sins or our losses through death, in solemnizing our hopes and in signifying unity with the divine. It must also be remembered that the mouth is used for many activities other than feeding. Infants and young children employ it as an organ of examination, manipulation and attack, just as subhuman mammals do. Older children and adults use it for kissing and, in an infinite variety of situations, as an organ of speech, grimace and oral gesture.

To all these potential sources of confusion must be added the influence upon a person of common metaphors, of fairy tales, folklore and superstition. Eating and drinking are related in stories, for example, to sudden body growth and shrinkage, to

miraculous changes in strength and beauty, to magical powers and magical helplessness, to fertility and impregnation and to the transformation of men into animals or gods. Thus, when a person becomes acutely anxious, insecure or disoriented, it should not surprise observers if he shows a disorganized intermingling of these different meanings, and tries to translate abstract symbols inappropriately into concrete action.

**Sex Need and Satisfaction.**—Early in the 20th century, Freud and his followers attached the greatest significance to sex in relation to behaviour pathology. The work of subsequent investigators, both psychoanalytic and nonpsychoanalytic, has in large measure verified this judgment Certain peculiarities of sex functions help to account for their pre-eminence. The direct satisfaction of sex need, for example, unlike the situation in hunger and thirst, can be delayed for long periods and even permanently denied without resulting in death. Accordingly, sex activities can be regulated and restrained to a degree that is not possible in the case of hunger and thirst Furthermore, although from infancy onward direct and indirect erotic stimulation can occur, full heterosexual satisfaction is biologically impossible for several years, while for several years more it is socially prohibited.

It is under precisely such conditions of intermittently occurring delay, thwarting and conflict that substitutive tension-reducing patterns of behaviour are acquired (*see* DEFENSE MECHANISMS) To the extent that these learned substitutive reactions lead to maladaptive results, they are likely to become implicated in the development of neuroses and psychoses. Of course, there are more cogent reasons for the social control of sexual satisfaction than the mere fact that control is biologically feasible. Mature sex behaviour involves two persons in a reciprocal relationship; and the one upon whom the biological burdens of pregnancy and childbirth fall is also the weaker of the two. Moreover, sex satisfaction is unique in leading to the production of new members of the social community, and the community therefore assumes the right to regulate the preliminaries of procreation and parenthood. Man shares with other mammals a further tendency to develop aggressive, jealous and vengeful attitudes with respect to courtship and mating Such a tendency demands that, for the sake of peace and security in the community, both rights and responsibilities be assigned to persons entering into these relationships.

In contemporary western society the taboo against sexual activities in childhood is usually extended to include taboo against their discussion. This is undoubtedly an important source of the sex confusions so commonly encountered in behaviour pathology. We know that attitudes become socially mature either through shared activities or through the interchange of perspectives that can develop in free discussion, particularly discussion with a socially mature person. Unfortunately, in matters of sex the average person has not himself enjoyed in childhood the benefit of frank discussions with a judicious, informed adult. Consequently, he is seldom equipped to help his own child acquire social maturity in this important area of human interest. He is easily embarrassed and made anxious by his child's sex curiosity and is therefore more likely to silence or reprimand his questioner than to meet each situation as it arises with mature effectiveness. The result is that the next generation grows up as little matured in sex attitudes as the last one.

During pubescence and adolescence there occurs a marked acceleration of biosocial maturing. This is in part the direct result of biological changes, in part the more indirect consequence of concomitant increases in social pressure. Sex problems, which in childhood were controlled by simple permissive and inhibitory training, now reappear with new vigour in a new social context. Instead of merely showing sex curiosity, the adolescent begins attempting seriously to interpret and play the role of his sex in terms of his peer culture. Adolescence thus becomes the phase of development during which ease and skill may be acquired in social behaviour with contemporaries of the opposite sex, an acquisition which aids in the general process of emancipation from filial dependence and prepares one for adult love relationships.

Under the influence of the social environment, sex needs and satisfactions undergo many significant modifications by the time adulthood is reached. It is expected that sex attitudes will be oriented toward marriage and family formation; and they cannot receive social recognition unless they conform to civil or religious codes Marriage, the family and the home are in turn made the basis of socioeconomic organization. In this way, sex attitudes and responses are brought into direct behavioural relationship with social and economic problems, with ethical standards of all kinds, with religious beliefs and practices, as well as with questions of hunger, thirst, warmth, shelter, security, approval and personal significance. Here we see how the groundwork is laid, in the domestic organization of life, for the unification of otherwise unrelated needs and satisfactions The same domestic organization leads also to the intricate confusions we find in behaviour pathology between sex conflicts and economic, social, religious and ethical questions.

**Primary and Derived Needs.**—The needs discussed above constitute only a fraction of those which are pertinent to abnormal psychology; they are, however, representative and they are unquestionably important. In relation to these and other needs, the attempt is sometimes made to distinguish between those which are primary and those which are derived. The primary needs are usually defined as the purely biological ones, while the secondary or derived needs are defined as the ones modified by the social environment or developed out of some nonbiological relationship. In practice, however, this distinction cannot be maintained None of the so-called biological needs fails to undergo far-reaching socialization, beginning early in life, and none of the so-called secondary or derived needs can ever be completely divorced from the human organism's physiological activities. Actually, all needs of significance to abnormal psychology are in this sense derived. they represent the disequilibrium of a biological organism which operates always in terms of its social environment.

## FRUSTRATION AND CONFLICT

**Frustration.**—By frustration we mean a situation in which ongoing motivated behaviour, or some organized plan of action, is permanently or temporarily prevented from reaching consummation. During all phases of the development, maturity and involution of personality, everyone must inevitably meet with repeated frustration. Need arises and there is delay, thwarting or conflict before it can be terminated and satisfaction reached. Each of us in his childhood acquires special adjustive techniques which enable him to circumvent, overcome, evade, nullify or disown the innumerable difficulties which can be solved neither by direct aggression nor by headlong flight (*see* DEFENSE MECHANISMS). Individuals show marked differences in the degree to which they develop these adjustive techniques, or defense mechanisms, in their preference for one defense over another, and in the degree of frustration they can withstand (*frustration tolerance*) before their preferred techniques prove inadequate, or operate to their own detriment.

During early infancy, of course, the commonest form of frustration is delay. The infant's inadequate biological equipment does not permit him to satisfy his needs without an older person's help. Delay continues to be an effective condition of frustration throughout life. As the growing child acquires greater strength and more aggressive techniques, he gains increasing familiarity with thwarting, a second form of frustration. His small size, his relative weakness and incompetence, and the obstacles which are intentionally or unintentionally placed between him and his goals, all contribute to [illegible] When he acquires speech and his thinking undergoes progressive socialization his needs multiply; and to the [illegible] obstacles that thwart him are now added symbolic obstructions such as verbal warnings, signs, rules and his own self-reactions. As he grows into adolescence and adulthood, his level of aspiration is raised in a great many relations, so that he never succeeds in reaching all his goals, no matter what his ability.

**Conflict.**—The third important form of frustration is conflict, by which we mean the mutual interference between competing reactions. This interference prevents ongoing motivated behaviour from developing adequately and reaching a consummatory phase. The competing reactions may be overt or covert, they may be confined to antagonistic changes in muscular tension, or they may be conceived of as mere shifts in action potential

Conflicts have been grouped into three classes adient-avoidant, double-adient and double-avoidant The adient-avoidant conflict involves two incompatible reactions, one directed toward and one away from an object, activity or goal What we call guilt is an adient-avoidant conflict in which temptation is the adient reaction, while the avoidant reaction is the partial inhibition which prevents consummation of the act but does not terminate it The sustained anxiety that develops in such conflict may eventually lead over into an anxiety disorder, phobia, compulsive or hysterical disorder. It is also responsible for many delusional and hallucinatory reactions in paranoid disorders, mania, depressions, schizophrenia and deliria.

Double-adient conflicts are of two kinds. In convergent adience only one object, activity or goal is involved, but the person gives two incompatible reactions toward it. Sibling rivalry, for example, typically includes simultaneously present hostile aggressive and affectionate accepting attitudes. In divergent adience there are two objects, activities or goals, and competing reactions toward both develop This conflict is characteristic of situations which promise a person a reward he wants on condition that he abandon something else he also wants Attempted solutions of divergent adience sometimes take the form of the enjoyment of one satisfaction in the public shared field of overt activity, and of the other satisfaction in private asocial fantasy. This is a common source of behaviour pathology.

The double-avoidant conflict involves two incompatible reactions, each directed away from some object, activity or goal This is characteristic of situations which threaten to harm a person if he remains and to punish him if he leaves, as for example in military combat situations It also appears where there is intense boredom, aversion or humiliation in the situation but the expectations of other persons, or the prospect of starvation, prevent one from abandoning it. Hysterical and depressive disorders are common pathological solutions of the double-avoidant conflict.

Although a great many conflicts disappear with time and distraction, or in the course of simple training, a great many more are not so easily resolved as this. Some of the latter are settled through compromise or substitution. In sibling rivalry, for example, the older child may substitute taunts, belittling comments and nonco-operation for the direct blows he would give his baby brother if he could. He may, on the other hand, overcompensate in denying his hostility and react instead with exaggerated solicitude toward his rival. He may attempt to escape his predicament by the radical expedient of running away from home, thus leaving the conflict field entirely. This last solution occurs among adults in hysterical fugues; the individual in conflict runs away from it and develops amnesia which hides his identity even from himself.

To settle a conflict does not guarantee that it will never return. If situations similar to the ones originally arousing it appear, the old conflict like an old remembrance may be reinstated. However, it is the incompletely resolved conflict that is most likely to keep recurring, and therefore to form a starting point for neurosis or psychosis. The recurrent conflict means recurrent tension, difficulty in relaxing or sleeping adequately, unreadiness for diversion and entertainment and an inability to achieve satisfaction for personally important needs. It may lead directly into chronic anxiety reactions, phobias or depressive disorders Some persons with perpetually recurring conflict develop compulsive rituals, hysterical disabilities or manic attacks as a defense against their anxiety. Others escape it by developing body overconcern, fatigue syndromes or schizophrenic withdrawal, which provides relief from anxiety but seriously impairs the individual's social usefulness.

**Conscious and Unconscious Conflicts.**—A conscious conflict is one that can be correctly identified or inferred by the person in conflict. An unconscious conflict is one that someone else can correctly identify or infer, but the person having it cannot There are, of course all gradations in accessibility between these two extremes Theorists in abnormal psychology have in the past gone beyond this simple distinction to [illegible] unconscious conflicts are radically different entities from conscious ones, and have located them in a hypothetical psychic region which they designate the unconscious Actually there is no need to introduce the hypothesis of a special, unconscious reality to account for the differences that we find in the relative accessibility of conflicts

We may begin with the observed fact that conflicts do vary in the degree to which they are accessible to the reactions of the individual having them Conscious conflicts are those which are fully accessible to a person's self-reactions; *i.e.*, to his reactions toward his own behaviour A person may share the fact of his conscious conflict with someone else or he may keep it to himself as a secret; but in either case the important thing is that he is able to formulate it to someone, to himself or to another individual If he keeps the conscious conflict to himself, of course, he can still debate it aloud in solitude, like Hamlet, or go over it silently in his socially organized thinking. The conscious or fully accessible conflict is frequently a source of behaviour pathology To identify or infer one's difficulties correctly is not to guarantee that they will miraculously disappear; if compromise, renunciation or escape cannot be carried through successfully, the situation may become just as intolerable as in the case of unconscious conflict.

However, in abnormal psychology it is the conflict which remains relatively inaccessible to a person's self-reactions, the unconscious conflict, that is by far the more important. To understand its origins, its consequences and the therapeutic techniques that have been developed to cope with it, is to understand the greater part of modern behaviour pathology. There are innumerable reasons for the inaccessibility of conflicts. Five of the simpler and more general factors will be listed here.

1. Conflicts become and remain inaccessible to a person (unconscious) because of previous threat or punishment. Early in life the threat or punishment comes from other persons, but as time goes on, a person learns to threaten, criticize, reject and punish himself. Moreover, the anxiety which threat and the prospect of punishment arouse is likely to generalize to situations not originally involved and not necessarily related in terms of strict verbal logic. Simple juxtaposition and concomitance, for example, are sufficient conditions for the development of new anxieties out of an old conflict.

2. Conflicts remain inaccessible (unconscious) if a person has never succeeded in formulating them. Language and socially organized thinking are of the utmost importance in the recall of any complex behaviour and in its analysis. Therefore, as long as a conflict remains unformulated in these terms it can rarely be adequately recalled and correctly identified as an effective factor.

3. Conflicts remain inaccessible (unconscious) because of strong emotional participation. When emotional components of behaviour are dominant in a conflict situation they may disorganize behaviour, at the time, or later on when recall is attempted. The recall of strongly emotional situations is also made difficult by the fact that it is seldom possible to reinstate the emotional components in their original intensity, or even with their original characteristics The therapeutic methods of recumbent free verbalization ("free association") are designed to facilitate the recall and the reliving of past incidents with something approaching their original intensity and character.

4. Conflicts remain inaccessible (unconscious) because a person cannot recall his fantasies. This difficulty is in part a result of the relatively loose organization of fantasy as contrasted, for example, with communicative speech. It is also frequently a result of repression (*see* DEFENSE MECHANISMS) Thus, anyone who is suddenly interrupted by someone in the midst of his fantasying may find himself incapable of remembering anything he has been thinking. We see this repeatedly in treatment situations where a neurotic patient, for example, will likewise show an inability to recall his own fantasy, and this inaccessibility frequently resists therapeutic attack for a long time.

5. Conflicts remain inaccessible (unconscious) because a person fails to recognize and accept the significant factors involved The average individual, no matter how intelligent or well-educated he may be. has neither the detachment nor the special training required for the successful analysis of his behaviour when he is in trouble. Sometimes, in relatively uncomplicated conflicts, it is possible for an expert to identify and explain significant factors in such a way that the patient can recognize and accept a correct interpretation with lasting benefit. Usually, however, the person in serious conflict cannot assimilate a ready-made interpretation. but must instead work out the significant factors himself with an expert's impartial help, even though this takes much longer and leads ultimately to essentially the same conclusions which the expert had come to early in the process

**Conscious and Unconscious Motivation.**—One of the basic assumptions in abnormal psychology is that all organized reactions are motivated. This simply means that the analysis of behaviour, if carried far enough, would always yield identifiable factors of special significance in the instigation, determination and sustaining of all organized acts. Such factors we call motives. The motive is thus not some form of hidden energy, a force, a drive or a first cause, as sometimes implied in popular writings. It is merely a verbal designation which is itself the product of our own operations in the motivational analysis of human behaviour

The unconscious motive is not to be thought of as something which lurks dangerously in a psychic underworld. The distinction between conscious and unconscious motivation, like that between conscious and unconscious conflict, rests upon the question of whether or not the motive is accessible to the individual concerned. If a person can correctly identify or infer his motivation, we speak of it as conscious; if he cannot, but someone else can, we call it unconscious. Some of the special characteristics ascribed to unconscious motivation undoubtedly result from the fact that what is inaccessible to a [illegible] escapes a great many of the socializing influences by which other behaviour is modified.

## INDIVIDUAL SUSCEPTIBILITY TO BEHAVIOUR DISORDERS

Sex differences, physiological age and relative biological competence may all enter into the determination of behaviour pathology in any given individual. However, when it comes to individual differences in susceptibility to behaviour disorders, the most important factors seem to be the differences in frustration tolerance, and in the development and use of special adjustive techniques, or defense mechanisms The wide variations in frustration tolerance, mentioned earlier, are to be found not only in comparisons of one individual with others, but also in comparisons of the same person's tolerance level at different times and under varying conditions of stress. Moreover, one person may exhibit low general frustration tolerance (*i.e.*, he reacts maladaptively to any ordinary frustration) while another may exhibit low specific frustration tolerance (*i.e.*, he reacts maladaptively to some particular group of frustrating circumstances but not to others). This multiple variability in resistance to frustration helps to account for the great range we find in both the intensity and the variety of precipitating factors in neuroses and psychoses.

Similar observations may be made concerning the development and use of special adjustive techniques or defense mechanisms. The failure to develop adequate defense reactions, for example, leaves one vulnerable in a crisis to mounting anxiety; and this may culminate in frank anxiety attacks, phobia or agitated depression. The overdevelopment and unskilled or injudicious use of defense reactions, such as rationalization and projection, often lead in the direction of delusional and hallucinatory behaviour. Likewise, regressive techniques may render an individual susceptible to hysterical disorders fatigue syndromes or hypochondriacal invalidism. Excessive fantasy favours a gradual withdrawal from participative activities; and this may in turn permit desocialization to develop and progress to a point at which the social disorganization of a person's behaviour justifies our calling it schizophrenia. Thus, we have also multiple variability in the maldevelopment and misuse of defense mechanisms to help explain the variation in degree and kind of susceptibility to behaviour pathology

**Childhood Influences.**—Individual differences in frustration tolerance and in the adequacy of adjustive techniques can be ascribed chiefly to differences in what is acquired in the course of childhood personality development. One of the most important factors influencing this development is that of the prevailing domestic pattern If the otherwise healthy child of a chronically fatigued or overanxious parent begins to exhibit habitual fatigue or exaggerated anxiety, the public is apt to blame biological inheritance. The child is said to be "delicate, like his mother," or "nervous, like his father." Actually, of course, these are examples of contact transmission, not biological inheritance, since teachers, playmates or neighbourhood invalids can have the same influence In short, children learn to adopt the attitudes and techniques prevalent among their elders or associates, whether these include abnormal reactions or not. If abnormal behaviour is acquired in childhood, and subsequently abandoned for something better, it may still leave an individual more susceptible than the average person to its reappearance, later in life, when new difficulties arise

Differences in the prevailing patterns in different homes help also to account for many of the variations we find, from person to person, in the kinds of behaviour pathology which develop under comparable conditions of stress—the so-called "choice of neurosis." If a chronically insecure parent meets his anxieties habitually by the use of compulsive ritual, this preferred technique may be adopted by the child. If the home environment is dominated by elders with chronic body overconcern, a child may grow up in it with hypochondriacal reaction-sensitivity to normal physiological functions. If a child is reared among adults or older siblings who show pathological fear of lightning, high places, sin, darkness, animals or contamination, he will be likely to acquire phobias himself, and to react later in life with these patterns of behaviour pathology rather than with others.

Children who are not given a maladaptive pattern of behaviour to adopt can, instead, be trained in one by their elders. An oversolicitous parent, with no serious doubts concerning his own body functions, may by worrying aloud over his child's minor discomforts, transient sickness or normal fatigue, unintentionally school the child in worrying over himself. Such a child learns to react to himself as his elder reacts to him, to interpret normal physiological events as signs of danger, and to develop a lack of confidence in his own health and strength. If he is given the privileged status of a sickly or delicate person because of his complaints, he may learn to utilize them to gain rewards, to avoid unpleasant tasks and to excuse failure. Likewise, the child whose parents are more overprotective than anxious, may nevertheless be trained in anxiety through the incessant warning, guarding, restraint and taboo with which he is surrounded. By learning to look always for danger before attempting anything, he develops a habitual expectation of danger and is thus rendered chronically insecure because of his selectively trained imagination.

Domineering parents sometimes control a child by keeping him continually dependent upon their emotional support and always uncertain of it. They give affection only as a reward for complete submission, and they withhold it the moment filial rebellion threatens to appear. The child trained in submission is an emotionally dependent child who is unlikely to develop adequate emotional independence in adolescence and become a socially mature adult. In business, professional, domestic and friendship relations, the adult with such a childhood is apt to expect special consideration and privilege from others, in return for dependent behaviour, and to misinterpret ordinary adult competition and detachment as hostility and rejection. The outcome may then be an abandonment of adult goals, with the substitution of less mature ones, or the elaboration of misinterpretations into delusional structures.

The child made oversensitive to guilt becomes especially vulnerable to behaviour disorder in adolescence and adulthood. Every child learns anxiety in relation to anticipated punishment, and when he is tempted to do something for which he has been previously punished or threatened, his anticipatory anxiety tends

to reappear. As they grow older, children learn also to use the words and attitudes of condemnation or threat toward their own behaviour (self-reactions) through which older persons had earlier controlled them These self-reactions are capable of arousing severe anxiety over one's own thinking, intending or doing forbidden things, and they are much more difficult to escape than the criticisms of other persons Under sufficient stress such conflict situations, for the individual overtrained in guilt reactions, may lead to the development of anxiety disorders, compulsive penitential or protective rituals, agitated depression, manic attacks or schizophrenic disorganization.

**Illness, Injury and Defeat.**—At any period of life, behaviour pathology may develop out of the circumstances incident to illness or injury. The sick and the injured are relatively helpless and dependent They commonly suffer pain, weakness, discomfort and disability which may form a basis for body overconcern, easy fatigability, chronic anxiety reactions or hysterical disorder. If patients are overtrained in watching over their physiological functions during convalescence, they may be unable to abandon this acquired solicitude when it becomes unnecessary and inappropriate. Moreover, the sick and disabled are granted special rights and exemptions which they lose as soon as they are well again. This leads sometimes to an indefinite prolongation of convalescence which, of course, is usually unplanned and unrecognized by the patient. Thus, chronic invalidism may follow upon illness or injury and lead to permanent hypochondriacal, fatigue or hysterical disorders.

Severe disappointment, disillusionment and defeat may also increase an individual's susceptibility to behaviour pathology at any age. The biosocial conditions of middle and late life, however, are especially apt to provide these factors The middle-aged or elderly person finds his general energy level diminishing, begins to realize the impossibility of ever reaching his hoped-for goals and sees himself gradually overtaken and then outdistanced or displaced by a younger generation. Like-aged relatives and friends in increasing number sicken and die, while the opportunities for acquiring new friends steadily decrease.

Many of the reactions to aging, for which explanations were once sought exclusively in brain pathology, are now recognized as the maladaptive behaviour of a person whose security and satisfactions have been undermined by biological waning and social restriction. In other words, the difference between normal and pathological senility cannot be completely expressed in terms of relative brain degeneration. It is also determined by the degree of stress or frustration to which the individual is subjected, his habitual reactions to it, his adaptability to change, and the consequences to him of the reduced social status that comes with increasing age.

## BEHAVIOUR DISORDERS

The behaviour disorders are relatively fixed, crystallized patterns of maladaptation. They have been divided traditionally into neuroses and psychoses. This division was originally based upon an erroneous hypothesis which attributed neuroses to nerve damage and psychoses to impairment of the psyche or the brain. The distinction is still preserved as a convenience in differentiating between disorders which justify legal commitment to a psychiatric hospital and those which do not. Freud attempted to divide neuroses further into those resulting from actual nerve disorder (actual neuroses) and those which he believed to be psychic (psychoneuroses). Although the concept of actual neuroses has proved to be unfounded, Freud's term psychoneurosis is used today to mean the same as neurosis.

Behaviour disorders are exceedingly difficult to classify. They cannot be grouped in accordance with aetiological agents, as infectious diseases can, because different individuals react to similar stresses in radically different ways. They cannot be grouped according to structural defects or lesions, since in the behaviour disorders none can be consistently demonstrated Consequently, they are classified in terms of behaviour pathology which means, of course, that all the difficulties inherent in classifying behaviour are carried over into abnormal psychology.

There were several official classifications in use at mid-20th century, each of which disagreed in some particulars with the others and possessed certain advantages in the eyes of its users. The three most widely employed in English-speaking countries were those sponsored, respectively, by the Royal Medico-Psychological association, the American Psychiatric association and the United States army The classification adopted, in the discussion which follows, is derived from these sources. It recognizes eight major disorders, of which the first five are customarily designated as neuroses (hypochondriacal disorders, fatigue syndromes, anxiety disorders, compulsive disorders and hysterical disorders), while the remaining three are the psychoses (paranoid, schizophrenic and manic-depressive disorders). In accordance with the United States army procedure, the organic psychoses are not included as a separate group. They will be discussed under *Cerebral Incompetence* at the end of this article.

**Hypochondriacal Disorders.**—The hypochondriacal person is habitually preoccupied with a supposed disease or defect in some part of his body which is functioning within normal limits; or he is exaggeratedly concerned over an actual disease or defect. Most hypochondriacs diagnose their own ills, and prescribe for and treat themselves; a great many consult physicians at least once or twice, and a minority do so chronically. In the United States, Great Britain and the dominions, millions are spent annually on patent medicines, tonics, laxatives, liver and kidney pills, antacids and the like, by persons whose illness lies not in the part they are treating but in their adaptation to the life they live. Since body overconcern is by no means confined to the well-to-do, the financial drain from this huge, unnecessary expenditure creates a serious socioeconomic problem. Even more serious, however, is the loss in a person's social effectiveness which constant preoccupation with body complaints inevitably entails.

It is not difficult to understand the origins of hypochondriacal disorders. Everyone is taught in childhood to observe his body functions, to comment upon them, to take pride in healthy performance and share his elders' concern over anything that goes wrong. If this training is too thorough, a child will become reaction-sensitive to some of the many normal activities of his body, and learn to watch and worry over them. Such an individual, when exposed later in life to prolonged anxiety or unsatisfied need, is likely to react with his already established patterns of body overconcern. As one might expect, gastrointestinal complaints head the list in hypochondria, even though fatal disease is actually much commoner in the cardiovascular system. Food intake, digestion and elimination are, after all, readily accessible to observation, discussion and control; and the vast amount of information and folklore available to the public focuses the attention of anxious and dissatisfied persons upon them.

**Fatigue Syndromes.**—In this group the patient speaks of continual fatigue and easy fatigability, in the absence of systemic disease or defect sufficient to account for them. A person with these complaints tends to avoid activities, situations and responsibilities that seem to induce or increase fatigue, and in consequence suffers a severe reduction in social effectiveness and in the opportunities left him for enjoyment. Some patients eventually lead a hermit's existence, shut away from all but a handful of friends whom they seldom see, and restricted to a routine which provides minimal disturbing stimulation.

Factors predisposing a person to develop pathological fatigue include childhood training in regarding oneself as weak or delicate, the example set in childhood by chronically fatigued adults and personal experience at any time of life with prolonged illness and convalescence. Under such conditions the individual may learn to react selectively to normal physiological events as if they were danger signals that he is overtaxing his strength. Fatigue in this sense is not an energy concept, but rather an attitude of aversion or unreadiness with respect to new or continued activity. It may result from overwork and inadequate rest, but it may equally well come from prolonged anxiety, frustration, disappointment or discouragement. This helps to explain the failure of rest and recreation to bring about a lasting improvement in persons suffering from pathological fatigue.

Fatigue syndromes, under the name of neurasthenia and nervous exhaustion were once called the American disease, and attributed to the strain of protracted conflict. The conflict was supposed to be that between the demands made by a ruthless, competitive mode of life and the ethical standards carried over from the more stable European culture. It was further believed that this situation depleted the supply of essential biochemical substances in the patient's nerves with consequent weakening of the nervous system. These hypotheses gave rise to the rest cure, the goal of which was to restore the nerves to their normal condition by overfeeding and complete inactivity. With the rise of modern behaviour pathology, both the rest cure and the hypotheses that gave it birth have been discarded.

**Anxiety Disorders.**—The prevalence of anxiety disorders is an expression of the fact that, although human beings are continually exposed to emotional stimulation, under the conditions of group living, they have relatively few opportunities for complete emotional reaction. They are frightened but cannot flee or hide, they are angered but cannot attack, they are sexually stimulated but cannot directly respond. Anxiety is the incomplete or amputated emotional response which appears under circumstances such as these.

If anxiety becomes persistent, and disturbs the pattern of a person's life, we speak of chronic anxiety disorder. The pathologically anxious person cannot relax, he sleeps poorly, has uneasy or frightening dreams and responds exaggeratedly or inappropriately on slight provocation. Because of his tension, he grows fatigued, irritable and dissatisfied, he cannot concentrate or remember as he once could and he usually develops visceral symptoms which reflect his emotional disturbance. He may have acute anxiety attacks, at irregular intervals, in which his heart palpitates, he sweats, his breathing grows laboured and he may think he is about to die; these attacks are frequently mistaken for signs of heart disease. Anxiety attacks in some persons take the form of acute gastrointestinal dysfunction, and in others resemble asthma.

Regardless of the precise symptomatology in anxiety disorders, the striking thing is that the patient rarely attributes his symptoms to their origin in the biosocial stresses and strains arising out of his personal and social problems. If he fails to get competent help, his next step is to avoid the situations which seem to arouse or increase anxiety, and to blame these situations for his predicament. Like the hypochondriacal and fatigued patients, he progressively limits his activities and his pleasures, and like them he decreases his general adequacy without gaining permanent relief. For no matter how many situations he avoids, he cannot escape the tensions of his own unrecognized needs and conflicts.

Phobia, or pathological fear, is an anxiety disorder in which the patient is able to identify the anxiety excitant, but cannot explain it. The commonest excitants of phobias are small, enclosed places, large wide-open spaces, public gatherings in or out of doors, high places, the dark, animals, germs and poisons. Actually, the situation or object which the patient accuses is as a rule some fragment, substitute or symbol of something which he has forgotten, repressed or never identified. It may have been part of a conflict which the patient has succeeded in partially repressing, without getting rid of his anxiety reaction to the partial rearousal. Treatment in phobias, as in other anxiety disorders, is directed not at the symptom but at its origins and what it represents.

**Compulsive Disorders.**—These are ritualistic attempts at dealing with anxiety. The compulsive reaction consists of an irrepressible tendency to think, say or do some particular thing which is opposed by a simultaneous tendency to resist thinking, saying or doing it. In this situation, tension gradually rises until the patient gives in and gains temporary relief. The variety of compulsive behaviour is great, and its seriousness ranges from the harmless repetition of rituals, such as checking several times each night to see that lights are out and doors are locked, to seriously antisocial activities such as stealing, arson, exhibitionism and assault.

Compulsive behaviour has interesting normal homologues in the attitudes of children toward familiar tales and organized play, where the same tense insistence upon ritual and meticulous repetition can be found. The same is true of the reactions of normal adults in relation to etiquette, rules of procedure in civil and military organizations, in institutionalized games, theatre performances and patriotic or religious ceremonies Discussion of pathological compulsions will be limited to one well-known syndrome.

Repeated handwashing, the classical example in this group, illustrates the salient features of compulsive disorders. As a reaction to the self-accusation of guilt, it performs the function of symbolically cleansing and disowning responsibility. After it has been performed a number of times, because of sinful deeds or fantasies, it is likely to grow into a more general reaction to any tension, whether guilt is involved or not. The annoyance and inconvenience of having to wash repeatedly also constitutes punishment, and this aspect is increased when the application of cleansing agents eventually brings about a painful chemical dermatitis. The penitential meaning becomes clear when the patient complains then that he takes pleasure in hurting himself. One sees here the division of behaviour into the role of the punitive parent and the sinful penitent child, a dual role which the patient has usually acquired in childhood, through learning to be overconscientious at the hands of a hypercritical, perfectionistic parent.

**Hysterical Disorders.**—These are characterized by persistent inactivation or autonomy which superficially resembles the product of neurological damage and disease. Actually, no neurological lesion is present, and the disorder arises in relation to need or anxiety. Hysteria, or "conversion hysteria" as it is commonly called, differs from hypochondria in one important respect. The hypochondriacal patient shows marked overconcern in relation to an organ or part which is actually performing reasonably well. The hysterical patient shows relative unconcern with respect to an organ or part which is obviously disabled. This is because the hysterical patient, in accepting his symptom as a sign of disability, frees himself from the tensions of frustrated need and conflict. Hysteria can be distinguished from malingering, with which it is usually confused, by the fact that the patient is himself convinced of the verity of his symptom as a sign of damage or disease.

The commonest examples of hysterical inactivation are those of hysterical aphonia, paralysis, anaesthesia, blindness and amnesia. In hysterical aphonia, or loss of voice, the organs of speech are usually normal and their participation in activities other than talking may be unimpaired. Aphonia appears under circumstances similar to those inducing normal loss of voice—acute anxiety, fright, sudden surprise, extreme disappointment or conflict. It may also follow tonsillectomy, some minor injury or an infection, which interferes temporarily with speech. The disability persists if it disposes of the tensions of intolerable need or anxiety; and it may disappear with dramatic abruptness when it no longer performs this function.

Hysterical paralysis and anaesthesia are not nearly so common as they were early in the 20th century. The reduction in incidence seems to be the result of public education and the great care now exercised by medical examiners in avoiding suggestion. However, when they do occur they are both striking and instructive. A person finds, for example, that following a fright, accident or operation, he cannot walk or cannot move an arm. Examination of the inactivated part fails to reveal evidence of tissue pathology adequate to account for the symptom; but the outcome of psychotherapy demonstrates that it represents the patient's attempt at adjustment in relation to deep personal need or anxiety. The skin of a hysterically disabled arm or leg may also be found insensitive to ordinarily painful stimulation. Sometimes such anaesthesia occurs alone. Its origin and meaning are the same as in the case of hysterical paralysis. Hysterical blindness has similar roots, but its significance may also include symbolic implications such as unwillingness to recognize, and self-punishment for the sinful use of seeing.

Hysterical amnesia, the loss of recall, is usually selective for

certain kinds of past events, but sometimes it is global and covers a complete episode. Nothing illustrates the extreme operation of repression better than global amnesia A person, caught in an intolerable conflict situation, may escape from it by repressing all remembrance of it. He may go further and exclude also the responses by which he establishes his own identity When this happens, we have the patient who cannot remember his own name or his status in society. This is the man whom the newspapers call "victim of amnesia" He is in fact the victim of overcomplete repression; he has carried to an extreme an adjustive technique which all of us use in getting rid of anxiety and frustrated need

The commonest examples of autonomy are the hysterical tremor, cramp and tic. The tremor is a rapid oscillatory movement, the cramp is a severe sustained muscular contraction and the tic is a relatively complex, co-ordinated movement. All three occur in normal behaviour. We call them hysterical when they are persistent or recurrent, and arise from need or anxiety, not from physiological impairment, intoxication or tissue damage. The so-called "occupational" tremor, cramp or tic illustrates such a relationship For example, a machinist who is otherwise well finds that his hand shakes whenever he tries to work but not in other situations A typist suffers a painful cramp each time she tries to type but finds no difficulty in writing longhand A taxicab driver develops head jerking on the job which makes driving impossible, but the jerking does not occur when someone else does the driving. The symptom in each instance is the expression of an incompletely repressed conflict; and if the conflict is resolved, the symptom will usually clear up quickly

Three other varieties of hysterical autonomy are relatively rare but psychologically important. These are the seizure, the fugue and multiple personality. The hysterical seizure is usually a dramatic re-enactment of some personally important role in the patient's life. During the attack phase, which may last from a minute or two up to several hours, the patient excludes the biosocial environment almost completely. When not in an attack, he usually cannot recall the events re-enacted in the seizure In hysterical fugue, the patient runs away from his conflict situation and becomes amnesic for his past, often to the point of losing his identity. Fugues seem to be related to ordinary sleepwalking.

Multiple personality is an extreme form of hysterical autonomy to which both fugue and amnesia may contribute. In one form, alternating personality, two organized systems of biosocial behaviour develop and alternate in dominating a person's activities. Each system is amnesic for events in the other The fictional representative of this form is Robert Louis Stevenson's Dr. Jekyll and Mr. Hyde. It is estimated that not more than 150 authenticated cases of multiple personality have been reported.

**Paranoid Disorders.**—This term is reserved for more or less systematized delusional reactions in patients who show neither serious disorganization nor deterioration. They develop as a rule under conditions of unusual anxiety, emotional arousal, strong personal need or physiological incompetence They frequently lead to behaviour that is socially detrimental, inappropriate or inept. Paranoid disorders are relatively common and in most cases curable. The relatively rare paranoia is an extreme, rigid form in which elaborate, highly systematized delusions prevail; it is seldom curable.

Emotional factors are of great importance in the origin and persistence of delusions. The insecure, tense individual who is for any reason unskilled in the social techniques of give-and-take, upon which adequate interpersonal relationships depend, is particularly vulnerable In his anxiety or frustrated need, the patient becomes reaction-sensitive to the activities of persons around him which seem to confirm his suspicions or hopes. If this development goes on unchecked, he begins to feel that he is the focus, or an important part, of some concerted action on the part of other persons, some of whom are actual individuals and some imagined. This organization of the human environment in terms of delusion is called a paranoid pseudocommunity. It may be conceived of as malignant or benign by the patient. When it seems to him that he is about to be attacked or exalted, he is likely to take action which brings him confinement and, in fortunate cases, psychiatric treatment.

**Schizophrenic Disorders.**—Delusional reactions also develop along less well-organized lines, show fantastic characteristics, self-contradictory attitudes and hallucination, such as one finds in normal dreams and in delirium. The patient, however, is neither asleep nor delirious but, on the contrary, may be well oriented and able to carry on complex biosocial activities impossible for a sleeping or delirious person Some of these activities, in severe cases all of them, will inevitably show the influence of the fantastic, ambivalent, hallucinatory disorganization which is present. This is what we call schizophrenia or, more accurately, the schizophrenic disorders, since there are many clinical varieties. It is customary to distinguish four general types of schizophrenic disorder However, these are no longer regarded as mutually exclusive forms but only as descriptive statements of the dominant behaviour the patient shows at the time Thus, if he postures, gestures, shows great excitement or grows mute and stuporous, he is called catatonic. If poorly organized delusions dominate the clinical picture, the patient is called paranoid schizophrenic If the patient hallucinates freely and behaves in a silly, giggling manner, he is called hebephrenic; and if he seems to fit into none of these categories, he is labelled simple schizophrenic. The United States army classification of 1945 advises against forcing all diagnoses into these arbitrary types.

The most impressive characteristics of the schizophrenic person are his disorganization and desocialization. The biosocial behaviour systems that constitute personality are to a considerable extent replaced by behaviour determined and dominated by private fantasy. The patient includes his fantasy products in the reactions he gives to his environment (overinclusion), with the result that his social behaviour becomes disorganized. This disorganization, in turn, interferes with normal communication and participative activities and so promotes the desocialization and further isolates the patient. If this process continues, the patient's behaviour may pass from the organization of a poorly systematized pseudocommunity to that of an autistic community, made up of the imagined activities of fictitious persons in a fantasied context.

The severity of schizophrenic disorganization led long ago to the conclusion that it must result from cerebral damage or metabolic disease. Research over a period of 50 years failed to support this hypothesis; and the complete or partial recovery of about half the adequately treated cases, including many severe ones, tends to contradict it. There is good evidence to indicate that personality traits acquired in childhood and adolescence are determinative factors.

**Manic-Depressive Disorders.**—Manic excitements are circumscribed episodes of elation or marked aggressiveness usually with grandiose delusions. Depressions are either [illegible] which case sustained tension, restless overactivity, despair and apprehensive delusions predominate, or else retarded, in which case the patient shows marked slowing and restriction of activity, with sadness, self-depreciatory delusions and dejection. Suicidal attempts are extremely common in depression. The close relationship of manic excitement to depression was widely accepted by the ancients. The old name, manic-depressive insanity, seems first to have been used in a medical essay of the 17th century which described both types of attack in the same patient. Contrary to popular opinion, it is actually unusual for mania and depression to occur in succession, as a cyclic reaction Even those patients who have both types in widely separated attacks constitute only about one-fourth of the total in this group Agitated depressions occurring in middle life are commonly called involutional melancholias. There is no general agreement as to whether or not they are of endocrine origin, and whether or not they are essentially different from agitated depressions at other periods of life.

Within recent years there has been growing recognition of the evolution of mania and depression from severe, prolonged anxiety

As Karl Abraham and Freud pointed out, there is often strong emotional ambivalence toward loved persons in the premorbid situation; and at some point in the development the original hostility is turned, from the loved person, against the patient himself. This change, the crucial shift, marks the onset of agitated depression in which self-condemnatory accusations are typical. The same change, in another person, leads to the profound self-depreciation and hopelessness of retarded depressions. If the patient, on the other hand, rejects and disowns self-condemnation or self-depreciation, he may overcompensate by developing elated grandiosity or aggressive self-assertion; and this constitutes manic excitement. The arrogance and clowning of manic patients are frequently mistaken for signs of mere overconfidence and happiness by relatives and friends, whereas they are actually the symptoms of a serious illness which may involve an individual in grave difficulties, and sometimes leads to his death.

**Cerebral Incompetence.**—The brain as an organ, particularly its cerebrum, cannot function efficiently unless a physiological equilibrium is maintained within a rather narrow range. This equilibrium may be disturbed by marked changes in body temperature, blood pressure and blood volume, by alterations in the composition of tissue fluids, cerebrospinal fluid and blood and by intoxication, brain disease and brain degeneration. Sudden changes often precipitate acute cerebral incompetence, and we have delirium, stupour or coma. More gradual changes may be compensated physiologically for a long time; but if this compensation ends abruptly, the result will again be acute cerebral incompetence. If, instead, there is a gradual reduction in the adequacy of compensation, we have progressive cerebral incompetence.

The United States army classification excludes cerebral incompetence as nonpsychiatric, unless behaviour disorder can be demonstrated, in which case the cerebral incompetence is regarded simply as one aetiological factor.

Behaviour disorders develop in patients with acute or progressive cerebral incompetence if their reduced biosocial adequacy makes them unable to deal effectively with their anxieties and frustrations. Suppose that a person has acquired adjustive techniques earlier in life which take care of serious personal conflicts through repression, identification and rationalization (*see* DEFENSE MECHANISMS). If his brain, the organ upon whose integrity such complex learned behaviour depends, becomes physiologically incompetent through intoxication, infection, injury or degeneration, the patient may suffer a rearousal of these conflicts because his adjustive techniques have been impaired. The result will then be a neurotic or psychotic reaction, the character of which will depend less upon present conditions than upon the conflicts and the patient's premorbid personality. This relationship has been demonstrated for alcoholic intoxication, general paresis and pathological senility, each of which may set the stage for the development of any of the behaviour disorders described above.

By the mid-20th century, it had become generally recognized that psychoses, in the cerebrally incompetent as well as in the cerebrally competent, could no longer be dismissed as mere reflections of brain pathology, nor could their treatment be limited to custodial care. This change was paralleled by a growing realization that neurotic patients were neither weaklings nor malingerers, but persons with legitimate claims to the privileges accorded the sick. It was chiefly to the credit of Freud that behaviour disorders had finally achieved a status of equality with other illnesses.

**ABO-BJ[illegible]**: *see* TURKU-PORI.

**ABODE.** In English law this term has a more restricted meaning than domicile, being used to indicate the place of a man's residence or business, whether that be either temporary or permanent. The law may regard for certain purposes, as a man's abode, the place where he carries on business, though he may reside elsewhere; so that the term has come to have a looser significance than residence, which has been defined as "where a man lives with his family and sleeps at night" (*R.* v *Hammond*, 1852, 17 Q B. 772) In serving a notice of action, a solicitor's place of business may be given as his abode (*Roberts* v *Williams*, 1835, 5 L. J M C. 23), and in more recent decisions it has been similarly held that where a notice was required to be served under the Public Health Act 1875, either personally or to some inmate of the owner's or occupier's "place of abode," a place of business was sufficient (*See* DOMICILE.)

**ABOLITIONIST,** an advocate of the abolition of slavery The term as used in the United States referred specifically to those persons who, during the years 1830–61, made it their mission to advocate the immediate abolition of Negro slavery. In spite of riots, assaults and persecutions of every kind, they carried on their task by means of the press, tracts, lectures and petitions to congress. Among the outstanding leaders of the abolitionist movement were William Lloyd Garrison, Wendell Phillips, Lucretia Mott and John Brown (*See* SLAVERY.)

**ABOMASUM,** the fourth or rennet stomach of ruminants It is that part of the digestive apparatus in which chemical digestion takes place. (*See* PECORA.)

**ABOMEY,** capital of the ancient kingdom of Dahomey, West Africa, now included in the French colony of the same name. Pop. (1936), 11,300, of whom 15 were Europeans. It is 70 mi. north by rail of the seaport of Kotonu. Abomey is built on a plain, 800 ft. above sea level. The town was surrounded by a mud wall, 6 mi in circumference, with a ditch 5 ft. deep, filled with a dense growth of prickly acacia, the usual defense of West African strongholds. There were six gates. Within the walls were villages separated by fields, several royal palaces, a marketplace and a large square containing the barracks. In Nov. 1892, Behanzin, the king of Dahomey, being defeated by the French, set fire to Abomey and fled northward. Under French administration the town has been rebuilt, placed (1905) in railway communication with the coast, and given an ample water supply. It is an important centre of fetish worship.

**ABOMINATION,** anything regarded with aversion as were things contrary to omen (Lat. *ab,* from, and *ominor,* forbode). Evil doctrines and impure ceremonial practices are so-called in the Bible. Hebrew authorities hold that the expression "abomination of desolation" (Matt. xxiv, 15; Mark xiii, 14) refers to the desecration of the sacred temple of Jerusalem by the erection of heathen statues (see *s.v. Jewish Encyclopedia*).

**ABOR** (*A-bari-* untamed), an Assam tribe inhabiting hills north of the Brahmaputra, subdivided into Minyong, Galong, Padam and other groups. They fall into patrilineal exogamous septs with traces of dual organization. A cross division exists into Mishing and Mipak—pure and impure, the latter condition being hereditary, and contagious as a result of sexual intercourse, though exogamy is not affected by it. The dead are buried; monogamy prevails, but the Galongs practise the levirate and polyandry within the family circle; slavery, tattooing and segregation of the unmarried obtain, but there is no headhunting. Public affairs are managed by elders and offenders are fined by the random confiscation of property; the property owner must execute the order of the court in order to recover from the culprit in his turn. Weapons used include long swords, crossbows, bows, poisoned arrows and spears. Men wear bark loincloths with tails, women a string of small circular metal plates—often the only garment.

*See* Duff-Sutherland-Dunbar, *Abors and Galongs* (1916); Cumming, *The Abors,* Assam Census Report, I, Appendix B, iii (1921).

**ABOR HILLS,** a tract of country on the northeast frontier of India, occupied by an independent tribe—the Abors, who are

Miri and Mishmi hills in the extreme north of Assam, where the Brahmaputra (Dihang) debouches on to the plain The country is exceedingly difficult and entirely mountainous and forest clad, with great rivers running for miles in rocky gorges, and unnavigable beyond Pasighat. Communication is only by the roughest tracks from village to village. The rainfall is very heavy. The term Abor is Assamese signifying "barbarous" and is applied by the Assamese to many frontier tribes; but is restricted especially to the above tract. The Abors frequently raided the plains of Assam. They were first visited by the English in 1826 From 1848 they carried out numerous raids and outrages on the neighbouring territory and several expeditions were sent against them, while a blockade was instituted from 1894–1900 From 1911 onward parties under military escort surveyed the border.

**ABORIGINAL LANGUAGES,** languages spoken by the native inhabitants of certain countries The term is generally applied to tongues called nonliterary languages, jargons, broken dialects, etc , but is more correctly used of languages which, whatever their state of development, have left their individuality unimpaired upon the territory where they originated. Aboriginal languages of Africa, for example, are the Bushman (*q v* ), dialects; of China, the Lolo (*q v* ), Man-tse, No-su, Mo-so, etc.

**ABORIGINES,** a mythical people of central Italy, supposed to have descended from near Reate (an ancient Sabine town) upon Latium, whence they expelled the Siceli and settled down as Latini under a King Latinus (Dion Halic. i, 9, 60). The etymology of the name (*ab origine*), makes them the original inhabitants (=Gr. *αὐτόχθονες*) of the country, but is inconsistent with the fact that the oldest authorities (*e g* , Cato in his *Origines*) regarded them as Hellenic immigrants, not as a native Italian people Other explanations suggested are *arborigines,* "tree-born," and *aberrigines,* "nomads."

The term "Aborigines" indicates the inhabitants found in a country at its first discovery. The Aborigines' Protection society was founded in 1838 in England as the result of a royal commission appointed at the instance of Sir T. Fowell Buxton to enquire into the treatment of the indigenous populations of the various British colonies

**ABORTION** means the termination of pregnancy before independent viability of the foetus has been attained. In humans, when modern facilities and expert care of the premature infant are available, such viability is at about the 26th week after the 1st day of the last normal menstruation. Miscarriage is the folk term for spontaneous abortion When this occurs before the 16th week of gestation, as it does in fully 75% of the cases, the foetus, if it were present at all, almost always has died two to five weeks before expulsion of the abortus. In about 50% of abortuses, no foetus is found; only an abnormal placenta (afterbirth) is present. If expulsion does not follow separation of the placenta or death of the foetus, the condition is called missed abortion and usually requires surgical removal of the abortus. It is estimated that about 12% of recognized pregnancies are aborted spontaneously. Meagre embryologic studies indicate that possibly 20% of fertilized ova are expelled before pregnancy can be diagnosed and that in about one-third of them no foetus, only placental tissue, is formed. Almost all the occult and most diagnosable miscarriages are caused by abnormal development of the embryo or the placenta. This is caused by intrinsic defects in the particular combining sperm or egg (the latter more frequent in women over 40 years of age), or occasionally to inadequacies of the lining of the womb where the ovum imbeds. In general, only an extreme dietary deficiency, a marked endocrine disorder or a gross toxic, anatomically defective or locally traumatized condition of the mother effectively impairs development of the normal conceptus The injurious role of the emotions is as yet entirely theoretic.

Adequate diet and good hygiene during childhood and adolescence will favour normality of male and female germ cells. The same treatment for the adult female with avoidance, correction or relief of disabilities mentioned as harmful to the conceptus will tend to supply its needs. When miscarriage is threatened by a showing of blood or by intermittent mild cramps, moderate sedation supplemented by inhibition of uterine contractions will help if the conceptus is still normal Contractions can usually be stopped by repeated intramuscular injection of at least ten milligrams of progesterone, the *corpus luteum* hormone, given at intervals no greater, and preferably less, than 48 hr. Inevitable abortion is associated with more or less haemorrhage, somewhat proportional to the duration of pregnancy, or with severe cramps, usually both. If evacuation of the uterus does not follow promptly, expert surgical removal of the abortus is indicated to prevent serious loss of blood Similarly, in cases where only part of the products of conception is extruded the rest should soon be removed surgically to avoid haemorrhage and infection

In most civilized countries, medical ethics and the law permit the deliberate termination of pregnancy, called therapeutic abortion, when the mother's health, life or reason is clearly jeopardized by continuance of the pregnancy and in the rare cases when grossly defective offspring can surely be expected. British law in 1938 recognized rape as justification. Even severely oppressive socioeconomic conditions alone are not valid reasons. He who wilfully causes abortion, as well as anyone who contributes to the act, in the absence of the indications mentioned, is liable to conviction of crime. As of 1947, no medical abortifacient is known that is effective without seriously endangering the mother's life. Surgical destruction and preferably prompt removal of the conceptus is the only effective therapeutic measure. In spite of the legal hazard and maternal risk, induced abortion destroys probably about 16% of diagnosable pregnancies in the United States, and doubtless many more in some European countries. The over-all mortality rate of legitimate therapeutic abortion is about 1%, lowest during the first weeks of pregnancy, increasing with age of gestation. The undiscoverable death rate of criminal abortion must be high, for in the United States in 1943, abortion contributed to 16% of maternal deaths.

**ABORTION, CONTAGIOUS:** *see* BRUCELLOSIS.

**ABOUKIR,** a village on the Mediterranean coast of Egypt, 14½ mi. northeast of Alexandria by rail. The meaning of the name is "Father Cyrus," who was a Coptic saint. Stretching eastward as far as the Rosetta mouth of the Nile is the spacious bay of Aboukir, where on Aug. 1, 1798, Nelson fought the battle of the Nile. Near Aboukir, on March 8, 1801, the British army, commanded by Sir R. Abercromby, landed from its transports in the face of strenuous opposition from a French force entrenched on the beach.

**ABOUT, EDMOND FRANÇOIS VALENTIN** (1828–1885), French novelist, publicist and journalist, was born Feb. 14, 1828, at Dieuze, in Lorraine. Among his college contemporaries at the École Normale were Taine, Francisque, Sarcey, Challemel-Lacour and Prévost-Paradol. Of them all About was, according to Sarcey, the most highly vitalized, exuberant, brilliant and "undisciplined." After a brief period spent at the French school in Athens he returned to Paris, and became an industrious and lively journalist. About's attitude toward the empire was that of a candid friend. He greeted the liberal ministry of Émile Ollivier at the beginning of 1870 with delight, and welcomed the Franco-German War.

With the fall of the empire he became a republican, and, always an inveterate anticlerical, he fought against the conservative reaction which made progress during the first years of the republic. From 1872 onward for some five or six years his paper, the *XIX^e Siècle,* of which he was the heart and soul, became a power in the land. On Jan. 23, 1884, he was elected a member of the French academy, but died Jan. 16, 1885, before taking his seat. About's best work is to be found, not in the once famous *Roman d'un brave homme* (1880), but in the books that are almost wholly farcical, *Le nez d'un notaire* (1862); *Le roi des*

*montagnes* (1856); *L'homme à l'oreille cassée* (1862); *Trente et quarante* (1858); *Le cas de M. Guérin* (1862). Here his most genuine wit, his sprightliness, his vivacity and the fancy that was in him, have free play.

**ABRABANEL, ISAAC,** called also ABRAVANEL, ABARBANEL (1437–1508), Jewish statesman, philosopher, theologian and commentator, was born at Lisbon of an ancient family which claimed descent from the royal house of David. Like many of the Spanish Jews he united scholarly tastes with political ability. He was a favourite of King Alphonso V, who entrusted him with important state business, but after his death in 1481 Abrabanel was compelled to flee to Spain, where he held for eight years (1484–92) the post of a minister of state under Ferdinand and Isabella. After the expulsion of the Jews from Spain in 1492 Abrabanel resided at Naples, Corfu and Monopoli, and in 1503 removed to Venice, where he was a minister of state till his death in 1508. Abrabanel was one of the first to see that for biblical exegesis it was necessary to reconstruct the social environment of olden times, and he skilfully applied his practical knowledge of statecraft to the elucidation of the books of Samuel and Kings.

**ABRACADABRA,** a word analogous to Abraxas (*q.v.*) used as a magical formula by the Gnostics of the sect of Basilides in invoking the aid of beneficent spirits against disease and misfortune. It is found on Abraxas stones, which were worn as amulets. The Gnostic physician Serenus Sammonicus gave precise instructions as to its mystical use in averting or curing agues and fevers generally. Subsequently its use spread beyond the Gnostics, and in modern times it is applied contemptuously to complicated, unscientific hypotheses.

**ABRAHAM** or (Genesis xi, 26–xvii, 5) **ABRAM** is the progenitor of the chosen people, the "seed" of the "promised land," Canaan (Gen. xii, 7; xiii, 15; xv, 18, etc.). He was the

ABRAHAM, THE FIRST OF THE GREAT BIBLICAL PATRIARCHS, BEING PREVENTED BY AN ANGEL FROM OFFERING UP HIS SON, ISAAC, AS A SACRIFICE. AFTER A RELIEF OF THE LIFE OF ABRAHAM ON THE DOORS OF THE BAPTISTERY, FLORENCE, BY GHIBERTI

first of the three Patriarchs He was extolled as "the Friend of God" (Isa. xli, 8; II Chron. xx, 7; *cf.* James ii, 23, and also the Mohammedan tradition), and as the "Father of the Faithful" (*cf.* Rom. iv, 11). To the present day the Jews trace their descent from him and from his progeny; who in accordance with the promise were to be as numerous as "the stars in the sky" (Gen. xv, 5) and "the sand on the sea shore" (Gen. xxii, 17). On the other hand in the New Testament it is declared that God can raise up children unto Abraham from stones (Matt. iii, 9), possibly an allusion to the myth of Deucalion and Pyrrha or to an Aramaic play upon words (*b'nīn* "sons," *abnīn* "stones"). To rest in Abraham's bosom, the bosom of the progenitor of the race, was the summit of eternal peace (Luke xvi, 22 *et seq.*).

**The Different Accounts.**—The stories in Gen. xi, 27–xxv, 11 belong to a larger whole. The basic conception upon which they are chosen and brought together is a single one. Despite all human opposition and despite all apparent despair and hopelessness, God holds forth his promise and brings to realization his scheme of salvation. Abraham, the bearer of this promise, is the pattern of peaceful and childlike faith, who stands firm against all dangers and disappointments. From the first his difficulties were exceedingly great.

He had to leave his home and people and, following the course of the sun, go on into a foreign land, the very name of which has not been told to him by God (Gen. xii, 1). The mighty Canaanites prevent his peaceful establishment (Gen. xii, 6), so he tarries in Shechem (xii, 6), Bethel (xii, 8), Hebron (xiii, 18), Gerar (xx, 1) and Beersheba (xxi, 33). At the very beginning he is compelled by a famine to leave Canaan and to go into Egypt, where his wife Sarai (Sara) is in danger through his untruth (Gen. xii, 10–20, *cf.* xx, 1–18, where the scene is Gerar). Hardly has he again settled in Canaan when dissensions among the shepherds bring a new danger, and he has to part from his only kinsman Lot. In calm trust in God, Abraham leaves the choice of locality to Lot (xiii, 9), who chooses the fruitful land on the other side beyond the borders of the promised land. Further difficulties arise when Lot falls into captivity (xiv) and, finally, into extreme danger, at the destruction of Sodom (ch. xix). Nevertheless here also Abraham's trustful confidence prevails, and he receives the promise of God in the form of a covenant (xv and xvii). There was to be born a son to the aged and childless couple and Abraham *believed:* his calm, childlike trust represents the just relation between man and God. This is the real meaning of the famous verse (Gen. xv, 6) with which, in the New Testament, the profoundest thoughts of the Christian doctrine of justification are connected (Rom. iv, 3; Gal. iii, 6).

A new side-issue is Abraham's marriage with Hagar, for the offspring of that union, Ishmael, cannot be heir (Gen. xvi, *cf.* xxi, 8 *et seq.*). Finally Isaac, "the son of promise," is born (xxi, 1 *et seq.*), and Abraham by means of a covenant with the king of Gerar gets a footing near the borders of the promised land (xxi, 22 *et seq.*). Then comes the severest test of his faith: the son of the promise must be willingly sacrificed! Even this test Abraham stands and God renews the promise (xxii), and yet toward the end of his days all that he has acquired as his estate is a grave (xxiii). This tomb of the Patriarch near Hebron is the sign that one day the whole territory shall belong to his descendants. Isaac, it it true, is still without an heir when Abraham dies in a good old age; and the old man's last thoughts concern themselves with the marriage of his son with a woman from his far-off home (xxiv). For Isaac is the heir, not Ishmael, or the children of Keturah; and Abraham has gained nought in the land of Canaan but a grave and his belief in the Promise.

**Analysis of Sources.**—These stories do not form a unity. The isolated stories whose concrete perspicuousness and brevity are unsurpassed are woven into a garland of sagas. They were collected in three or four larger works and finally put together in their present form, from the above-mentioned point of view. (*See* BIBLE: *Old Testament* and GENESIS.) To the latest work, the so-called Priestly Codex (P.), are ascribed Gen. xi, 27, 31, 32; xii, 4*b*, 5; xiii, 6, 11*b*, 12; xvi, 1*a*, 3, 15, 16; xvii; xix, 29; xxi, 1*b*, 2*b*–5; xxiii; xxv, 7–11*a*. As the work of the Elohist (E) are reckoned chapters xv and xxiv (?) in part, and nearly all of chapters xx, xxi and xxii. The rest belongs to the works of the two Jahwists (L, *i.e.*, the older "Lay-source" [so Eissfeldt] and J). The accuracy of this analysis is, however, in some details doubtful More important is the fact that the stories, despite many noticeable duplications (*cf.* xii, 10 *et seq.* and xx; xv and xvii; xvi and xxi), agree in all essentials. The etymological

explanations of names and word-plays are of fundamental importance as stylistic criteria.

**Historical Value.**—The style and content of the stories deviate from strictly historical writing. The narrative does not concern itself with the political, social and economic events and conditions in the life of the peoples (with the sole exception of xiv, on which see below), but with family idylls, delineated with an artist's love, the details of which, however, are beyond the reach of the historian. The question, therefore, of the real historical worth of the details is difficult to decide. On the other hand, scepticism as to the historicity of the patriarch himself goes too far. Some would suppose that the figure of Abraham owes its origin merely to the imagination of the poet; or that Abraham is merely a personification of the people who derived themselves from him, and that the sagas and legends concerning him and other patriarchs are only a reflection of later tribal history. According to other scholars, the heroic figure of Abraham is based on a Canaanite god who was worshipped in the holy trees of Shechem and Hebron. In this case the Israelites are supposed to have taken over the cult-centres and the rites; although, judging from their hatred of the earlier peoples, it is not very likely that they humanized their gods and heroes and regarded them as the progenitors of their own people All these explanations, however, have an air of unreality about them. From beginning to end all that Abraham does and suffers is peculiar to individuals. Mythical outlines are wholly wanting, even miracles are not ascribed to him (in contrast, for example, to Moses). Even his human failings are not disguised (his untruth, xii, 13; xx, 2; his frailty, xvi, 6; his doubts, xvii, 17). Were his shape devised with something of the idea of establishing Israel's right to Canaan, one would look for some other sort of figure. According to the later sagas—some of which have been preserved—the Patriarchs were mighty heroes who conquered the land with signs and miracles, and held firmly to the later sacrificial and food laws. It is just the unfavourable traits in the characters of the Patriarchs and the undesirable traits in their lives, and the consciousness of a difference between the patriarchal and the Mosaic period as regards the idea of God and the cults, that must rest on an historical foundation.

**The Two Names: Abram and Abraham.**—The double name is peculiar, *Ab-ram* means "the father is exalted" or "the exalted father"; the word "Patriarch" is really nothing more than a Greek translation of this name. Lesser known bearers of the name were called *Abiram* (Num. xvi, etc.). *Ab-rāhām* is the new name which the patriarch received from God from the moment of the solemn covenant (Gen. xvii, 5). A new name—mostly with a slight variation (*cf.* Sarai-Sara, Hosea-Joshua, Eliąkim-Jehoiakim, Saul-Paul)—indicates a new period in the life of the bearer. This name is explained in Gen. xvii, 5 as "Father of a Multitude," which in Hebrew would be *Ab-hamon;* but the second part of the compound is preferably compared with an Arabic word for "crowd" (*rūhām*). This explanation is however probably a popular etymology: it is most probable that the two names Abram and Abraham mean precisely the same thing. *Abram* may be the Accadian (Babylonian) and *Abraham* the Amorite (Canaanite) form of the same name. It is among the Amorite peoples in Babylonia during the first dynasty that names are found like *Abaram, Abam-rama,* and probably even *Aba-raham* (*cf.* for the last form Lutz, *Early Babylonian Letters from Larsa* [1917], No. 15). Thus it seems that this name was in use in Abraham's old Babylonian home, the regions of Ur and Larsa.

**Chronological Questions.**—For determining the date of Abraham the 14th chapter of Genesis is the starting point. In this noteworthy chapter are given the names of kings and lands, and Abraham appears as a warlike hero. The identification of these kings with the great Babylonian king Hammurabi and those of his time would seem to be erroneous. It is probable that the chapter deals with a punitive expedition undertaken by two princes of the middle Euphrates (*Amraphel;* i.e., *Amur-apil* and *Arioch* or *Āriaka*) in the service of the allied kings of *Khatti* (*Tid'al;* i.e., *Tid'alia, Dudhalia*). They were beaten by the attack of a much smaller number of Hebrews under Abraham: it was the unforgettable first military exploit of this people on Canaanite soil. Now, of these kings we know from the cuneiform inscriptions that Tid'al I was the founder of a dynasty of the kingdom of the Hittites (Khatti), and that he lived somewhere about 1550 B.C (or at the latest 1450 B.C.). It is therefore probable that we must place the time of Abraham about this date. With this agrees the little that is known of the political life of the dark age after the downfall of the Hyksos kingdom. The biblical chronology does not actually contradict this late dating, for the dates in Gen. xxi, 5; xxv, 26; xlvii, 9; Exod xii, 40 and 1 Kings vi, 1 belong to an artificial scheme, whereby precisely 12 centuries elapse from the birth of Abraham to the building of Solomon's temple. To make up these 12 centuries the length of a generation was reckoned first as 100 years, then as 40. But the older literary sources in the Old Testament give another picture; above all, the genealogical tables present good ancient evidence. On the basis of statements such as are found in Gen. xv, 16; xxxvi, 31–39 (*cf.* Num. xx, 14), Gen. l, 23; Exod. vi, 16–20, Ruth iv, 18–22, the period between Abraham and David must at the most be reckoned as 600 years, probably much shorter.

From the historical point of view Abraham's journey from Mesopotamia to Canaan is directly bound up with the wandering of the Moabites, Ammonites and Edomites to the southwest and southern Canaan, and with the wandering of the Aramaeans to Syria. An invasion by the non-Semitic tribes of the Mitanni and Kharri (about 1600 B.C.) expelled these Hebrews and Aramaeans from their old homes on the middle Euphrates, in a southwesterly direction. In the course of this migration individual Hebrew families (viz., Abraham and his kindred) came to Canaan; but there was no intention in the first instance of conquering this ancient land of culture.

**The Religious Significance.**—It has been shown that Abraham's journey from Ur (Gen. xi, 28) *via* Harran (xi, 31) to Canaan was merely a part of a greater movement of peoples. But, according to Biblical tradition, this journey had a precise objective and aim; God's direct command already contained a religious motive (Gen. xii, 1 *et seq*). Abraham is no leader of a Bedouin tribe seeking plunder and conquest; his significance lies rather in the field of religion. He is not, in the first instance, the progenitor of the people but the founder and leader of a religious movement. Like Mohammed, some 2,000 years later, he stood at the head of a great movement among the Semitic peoples and tribes. Naturally, his adherents were bound to each other firmly by blood ties. Abraham's religion was characterized by abstraction and was yet personal. The *one* great God, throned in heaven, honoured without priests and temple, the Almighty and all-comprehending One, to whom the faithful have personal access—this is Abraham's God so far as we can gather from our sources. And that is more important for us than the question of the details of the tradition. While Abraham's forefathers in Mesopotamia served other gods (Josh. xxiv, 2), "The God who redeemed Abraham" was the same as the God of Moses (*cf.* Exod. iii, 6, 13 *et seq.*) and of Elijah (1 Kings, xviii, 36). According to the Old Testament, Abraham was the founder of the Israelite faith, and Moses the founder of the nation's thought and reformer of the cultus. *See* GENESIS.

Wissenschaft,* pp. 1–31 (1910); on the word-plays and the form of the stories *see* Böhl, *Journal of the Palestine Oriental Society* pp. 206–212 (1926); on the Chronology, Albright, "The historical background of Genesis xiv," *Journ. of the Society of Oriental Research,* pp. 231–269 (1926). The present writer has discussed the views taken above, in the *Zeitschrift der Alt. testament Wissenschaft.* pp. 65–73 (1916); pp. 148–153 (1924); also in a commentary on *Genesis* (in Dutch), 2 vol. (1923–25), and in a paper (Dutch), *The Period of the Patriarchs* (1925) (F. M. T. B.)

**ABRAHAM, WILLIAM** (1842–1922), British Labour politician of the old school, was born in the Afon valley and went to work in a coal mine at the age of nine. He was affectionately known by the name of Mabon, a name originally adopted by him in Eisteddfod competitions. President of the South Wales Miners' federation, he was a power in South Wales, and he remained a

respected figure to the end. He sat in the house of commons for Rhondda from 1885 to 1920 and died on May 14, 1922.

**ABRAHAM, THE PLAINS OF,** a plateau to the southwest of the city of Quebec, the scene of the historic battle between the French under Montcalm and the English under Wolfe on Sept. 13, 1759. (*See* QUEBEC.)

**ABRAHAM A SANCTA CLARA** (1644–1709), Austrian divine, was born at Kreenheinstetten, near Messkirch. His real name was Ulrich Megerle. In 1662 he joined the order of Barefooted Augustinians, became a popular preacher and assumed the name by which he is known. In this order he rose step by step until he became *prior provincialis* and *definitor* of his province. He died at Vienna on Dec. 1, 1709. In his published writings he displayed the same force and homeliness as in the pulpit.

BIBLIOGRAPHY.—His works have been several times reproduced in whole or in part, though with many spurious interpolations. The best edition is that published in 21 vol. at Passau and Vienna (1835–54). *See* Th. G. von Karajan, *Abraham a Sancta Clara* (Vienna, 1867); H. Mareta, *Über Judas d. Erzschelm* (Vienna, 1875); Schnell, *Pater A. a S.C.* (Munich, 1895); Sexto, *Abraham a S.C.* (Sigmaringen, 1896); Blanckenburg, *Studien über die Sprache Abrahams a S.C.* (Halle, 1897).

**ABRAHAM IBN DAUD** (*c.* 1110–80), Jewish historiographer and philosopher of Toledo. His historical work was the *Book of Tradition* (*Sepher Haqabala*), a chronicle down to the year 1161. It was translated into Latin by Génébrad (1519). His philosophy was expounded in an Arabic work better known under its Hebrew title *'Emunah Ramah* (*Sublime Faith*). This was translated into German by Weil (1882). Ibn Daud was one of the first Jewish scholastics to adopt the Aristotelian system. Maimonides owed a good deal to him.

**ABRAHAMITES,** a sect of deists in Bohemia in the 18th century, who professed to be followers of the precircumcised Abraham. Believing in one God, they contented themselves with the Decalogue and the Paternoster. Declining to be classed either as Christians or Jews, they were excluded from the edict of toleration promulgated by the emperor Joseph II in 1781, and were deported to various parts of the country, the men being drafted into frontier regiments. Some became Roman Catholics, and those who retained their "Abrahamite" views were not able to hand them on to the next generation. As a religious sect they disappeared by the end of the century.

**ABRAHAM-MEN,** the nickname for vagrants who infested England in Tudor times. The phrase is as old as 1561, and was due to these beggars pretending that they were patients discharged from the Abraham ward at Bedlam.

On his discharge the genuine Bedlamite, provided he wore a badge, was allowed to roam the country, soliciting alms. This humane privilege was grossly abused, and thus gave rise to the slang phrase "to sham Abraham."

**ABRANTES,** a town of central Portugal, in the district of Santarem, formerly included in the province of Estremadura. It is on the right bank of the river Tagus, at the junction of the Madrid-Badajoz-Lisbon railway with the Guarda-Abrantes line. Pop. (1940), 4,170. Abrantes, which occupies the crest of a hill covered with olive woods, gardens and vines, is a fortified town, with a thriving trade in fruit, olive oil and grain. As it commands the highway down the Tagus valley to Lisbon, it has usually been regarded as an important military position. Originally an Iberian settlement, founded about 300 B.C., it received the name Aurantes from the Romans; perhaps owing to the alluvial gold (*aurum*) found along the Tagus.

Roman mosaics, coins, the remains of an aqueduct, and other antiquities have been discovered in the neighbourhood. Abrantes was captured on Nov. 24, 1807, by the French under Gen. Andache Junot, who for this achievement was created duke of Abrantes. By the Convention of Cintra (Aug. 22, 1808) the town was restored to the British and Portuguese.

**ABRASIVES.** Abrasion is a scratching action and depends on the relative hardness of the two materials—the abrasive and the one abraded. The degree of hardness of a material, as determined by scratching, has long been used by mineralogists for distinguishing one mineral from another, and F. Mohs in 1820 devised a scale of hardness for minerals, which is still in use. Mohs's scale is:—

| | | |
|---|---|---|
| 1. Talc | 5. Apatite | 8. Topaz |
| 2. Gypsum | 6. Feldspar | 9. Corundum |
| 3. Calcite | 7. Quartz | 10. Diamond |
| 4 Fluorite | | |

Diamond at No. 10 is the hardest of all minerals and indeed of all known substances. Steel (a knife-blade or file) will scratch feldspar but not quartz, and it is itself scratched by quartz; it can therefore be set at $6\frac{1}{2}$ on the scale. Window-glass at $5\frac{1}{2}$ can be abraded and polished by feldspar. The higher a material stands in the scale the more efficient is it as an abrasive, diamond being the most efficient of all.

Mohs's scale is arbitrary and merely comparative, and it gives no absolute measure of the degree of hardness of a material. Attempts have been made to arrive at this by various methods: such as by measuring under a microscope the depth of scratch produced by a diamond point under a certain load; or by determining the amount of work done in grinding away a certain weight or volume of material. From such experiments it is found that the gap between 10 and 9 on Mohs's scale is even greater than that between 9 and 1, emphasizing again the efficiency of diamond as an abrasive.

Brittleness or friability is another physical character to be considered in addition to hardness. Carborundum although exceeding corundum in hardness is much more brittle, and it soon crushes and rubs down to a fine flour. Diamond with rough usage breaks along the directions of perfect cleavage in the crystal. For this reason carbonado, a compact aggregate of minute diamond crystals, rather than a single crystal, is used in rock-drills.

The form in which abrasives are used varies for different purposes. The material may be crushed and sieved to different degrees of fineness. This may be used as a loose powder for grinding; or it may be glued on cloth or paper, or bonded with cements in the form of grinding wheels or hones. Other abrasives are used in block form cut to a suitable shape, as grindstones, millstones, scythestones, whetstones, pumice blocks, etc. Besides being used for grinding and polishing metal, stone, wood, leather, etc., abrasives are also employed for cutting, drilling and boring.

In addition to natural minerals, certain artificial products are also used for abrasive purposes. For example, powdered glass as glass paper, crushed steel for stone cutting, and the important carborundum. Corundum is also produced artificially on a large scale. Carbides of boron, tantalum and tungsten are extremely hard, and these may in the future find technical applications.

In the following list the various abrasive agents are arranged according to their degree of hardness, *i.e.*, in the order of their efficiency. Further information respecting each of these materials will be found in the separate articles (*see* DIAMOND, etc.).

*Diamond* (Hardness = 10). This is a crystallized form of carbon, and only the natural mineral is available. Cloudy, spotted and imperfectly crystallized stones, known as bort, and small fragments that cannot be cut as gems are crushed to powder for use as an abrasive. Diamond powder is the only material with which diamond itself can be ground and polished.

*Carborundum* (H. = $9\frac{1}{2}$). This artificial product is a crystallized carbide of silicon (CSi), and since its discovery in 1891 it has more and more replaced mineral abrasives. It is produced in large quantities by heating coke and sand in electric furnaces. It is used in the form of powder either loose or on cloth, or is made up with porcelain, shellac or other bonding material in the form of grinding wheels, hones, etc. This material is sold under a variety of trade names—crystolon, carbolon, samite, etc.

*Corundum* (H. = 9) is the crystallized oxide of aluminum ($Al_2O_3$), a mineral which in its gem varieties is ruby and sapphire. Rough corundum is found as large crystals in certain kinds of igneous rock in Canada, North Carolina, Ural mountains, Madagascar, and South Africa, the last being now the principal producer of material for abrasive purposes. *Emery* is an impure granular variety of corundum mixed with magnetite and other minerals, and it is not quite so hard as the purer crystal or rock corundum. It is mined in Naxos, Asia Minor and the state of New

York. Much corundum is now produced artificially by fusing bauxite in electric furnaces, the product being sold under the names alundum, adamite, aloxite, lionite, etc.

*Garnet* (H.=6½–7½) as mined in the eastern United States and in Spain for abrasives is mainly the almandine variety, a silicate of iron and aluminum. It is largely used for making garnet paper (often sold as emery paper).

*Quartz* (H.=7) is a crystallized form of silica (oxide of silicon, $SiO_2$) and is the commonest of all minerals, occurring in a bewildering variety of forms It finds extensive applications as an abrasive. Millstones, grindstones and pulpstones (for grinding wood in the manufacture of paper) are made of quartzite, burrstone, grit or sandstone. Whetstones are made of hornstone, Lydian stone, Arkansas stone, and other compact varieties of quartz. In the form of sand, quartz is used as a sandblast, as sandpaper, in scouring soap, and for cutting and grinding marble Pebbles and flints are used for grinding cement materials and clinker.

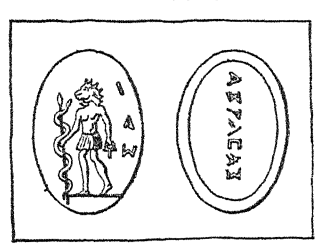
*Steel* (H.=6½) Crushed crucible steel, crushed cast iron and steel shot are used in stone cutting.

*Feldspar* (H.=6), the potash-feldspar, orthoclase or microcline ($KAlSi_3O_8$), is used for polishing plate glass and in scouring soaps.

*Glass* (H.=5½), powdered glass as glass paper or sandpaper.

*Pumice* (H =5½), a natural volcanic glass blown by included steam into a cellular mass. The best block pumice is from the Lipari Islands, and enormous quantities of pumice-dust are available in the United States.

*Opal* (H.=5), a hydrated glassy form of silica, found in a powdery form as large deposits of tripoli, diatomaceous or infusorial earth, and largely used for polishing and in scouring soap.



Rottenstone, chalk, rouge, putty powder and other softer grinding and polishing materials might also be mentioned.

Abrasives, in the household, are substances of an erosive nature used for polishing or cleaning purposes. Those best suited for this use are fine sand, emery, crushed pumice and chert, which consists of siliceous skeletons of sponges and marine shells. These materials are often mixed with a solution of soap, so that there is a cleansing action as well. In the cleaning of aluminum, steel wool, in combination with an abrasive powder or soap, has a wide usage. Abrasives are in very general use and have done much to lighten the housewife's work They may be purchased in paste, powder or cake form and used for cleaning and polishing all kinds of metals, as well as scouring paint and enamelware.

**ABRAUM SALTS** (from the German *Abraum-salze*, salts to be removed), the name given to a mixed deposit of salts, including chlorides and sulphates of sodium, potassium and magnesium, found in association with rock salt at Stassfurt in Prussia.

**ABRAXAS** or **ABRASAX,** a word probably first used by the Basilidians and engraved on certain antique stones, called on that account "Abraxas stones." The letters of ἀβραξάς in the Greek notation make up the number 365, and the Basilidians gave the name to the 365 orders of spirits which emanated in succession from the supreme being. These orders were supposed to occupy 365 heavens, each fashioned like but inferior to that above it, the lowest being the abode of the spirits who formed the earth and its inhabitants, to whom was committed the administration of its affairs. In addition to the word Abraxas the stones often have cabalistic figures engraved on them.

OBVERSE AND REVERSE OF AN ABRAXAS STONE ATTRIBUTED TO THE BASILIDIANS

**ABROGATION,** the annulling or repealing of a law by legislative action or by usage. Abrogation, which is the total annulling of a law, is to be distinguished from the term *derogation,* which is used where a law is only partially abrogated Abrogation may be either express or implied It is express either when the new law pronounces the annulment in general terms, as when in a concluding section it announces that all laws contrary to the provisions of the new one are repealed, or when in particular terms it announces specifically the preceding laws which it repeals. It is implied when the new law contains provisions which are positively contrary to the former laws without expressly abrogating those laws. The abrogation of any statute revives the provisions of the common law which may have been abrogated by that statute (*See* STATUTE; REPEAL)

**ABRON,** a longheaded tribe, physically akin to the Fanti, living on the Ivory Coast (Bondoukou region) and between Kintampo and Salaga, Gold Coast. The natives are husbandmen and traders, and they practise Animism There are small kingdoms made up of several provinces. The family is constituted by several subgroups which embrace a number of households. Marriage between cross-cousins is frequent. Descent is reckoned in the paternal lines. Inheritance passes to the maternal uncle, then to the nephew, the sister's son. Society consists of (1) nobles, (2) freemen, and (3) slaves and descendants of slaves. The judiciary organization is fairly well developed

*See* Tauxier, *Le Noir de Bondoukou* (1921).

**ABRUZZI, DUKE OF THE** (1873–1933), Italian vice-admiral and explorer, son of Amadeo, duke of Aosta, was born at Madrid Jan. 29, 1873, and named Luigi Amadeo. Although he had a distinguished naval career he achieved fame also as a traveller and mountaineer. He was the first to ascend Mt. St. Elias in Alaska (1897) and in 1899 he organized a North Pole expedition, part of which reached lat. 86° 3′ N., at that time the record of northern exploration, he himself being forced to remain behind owing to frostbite. In 1906 he was the first to ascend the Ruwenzori in East Africa, reaching the twin summits (16,795 ft.) which he named Margherita and Alexandra. He also made the first detailed map of the Ruwenzori. In 1909 he ascended K 2 in the Himalayas to an altitude of over 20,000 ft. and on July 18 Bride peak to 24,600 ft. During World War I he commanded the naval forces in the Adriatic, but he resigned in 1917 owing to disagreements with Admiral Thaon di Revel, his chief of staff, and retired from the service. Afterward he undertook to carry out an important colonization scheme in Italian Somaliland.

English translations of his works are *The Ascent of Mount St. Elias* (1900); *Ruwenzori* (1909).

**ABRUZZI E MOLISE,** a group of provinces (*compartimento*) of south central Italy. The area is 5,954 sq mi. and the population (1936) 1,600,631. The interior is mountainous including the central portion of the Apennines and their culmination, the *Gran Sasso d'Italia*. The coastal hills consist mainly of somewhat unstable clay and sand; the zone of level ground along the coast is quite inconsiderable. The 100 mi. of coast have not a single harbour of importance. Climate varies with altitude, the highest peaks being covered with snow for most of the year, while the valleys running northeast toward the sea are fertile and well watered by several small rivers, the chief of which are the Tronto, Vomano, Pescara, Sangro, Trigno and Biferno. These are fed by minor streams, such as the Aterno and Gizio, with valleys between the main chains of the Apennines. They may be suddenly swollen by rains, and floods and landslips often cause damage. This danger has been increased, as elsewhere in Italy, by indiscriminate timber-felling without provision for reforestation, though considerable oak, beech, elm and pine forests still exist and are the home of wolves, wild boars and even bears. The woods have large herds of swine, and the hams and sausages of the Abruzzi are famed. The rearing of cattle and sheep was at one time the chief occupation, and many flocks are still driven down to the Campagna di Roma for the winter and back again in the summer, but more cultivation is now done, especially in the valleys and in the now drained bed of Lago Fucino where beet sugar is produced. Industries are small but various: *e.g.*, arms and cutlery at Campobasso and Agnone and majolica at Castelli and elsewhere. Liqueurs are also made in several places. The river Pescara and its tributary the Tirino form an important source of power for generating elec-

tricity. Communications are not easy. Railways are (1) the coast railway (a part of the Bologna-Brindisi line), with branches from Giulianova to Teramo and from Termoli to Campobasso, (2) a line diverging S.E. from this at Pescara and running via Sulmona (whence there are branches via Aquila and Rieti to Terni, and via Carpinone to [a] Isernia and Caianello, on the line from Rome to Naples, and [b] Campobasso and Benevento), and Avezzano (whence there is a branch to Roccasecca) to Rome, (3) a connecting line between the coast (at Ortona and S. Vito Lanciano) and the line from Solmona to Isernia (at Castel di Sangro). There are, consequently, no large towns The district was, in Lombard times, part of the duchy of Spoleto and, under the Normans, a part of that of Apulia; it was first formed into a single province in 1240 by Frederick II who placed the *Justiciarius Aprutii* at Sulmona and founded the city of Aquila After the Hohenstaufens lost their Italian dominions the Abruzzi became a province of the Angevin kingdom of Naples, to which it was of great strategic importance.

**ABSALOM,** the third son of David, and his father's favourite. The picture presented in II Sam. xiii–xix (which deals mainly with his life) suggests that he was the Alcibiades of the Old Testament, alike in his personal attractiveness, his lawless insolence and his tragic fate He is first mentioned as murdering his half-brother Amnon, David's eldest son, in revenge for the rape of his full sister Tamar This deed drove him into banishment, but he was eventually restored to favour through the good offices of Joab. Later, when some uncertainty seems to have arisen as to the succession, Absalom organized a revolt. For a time he seemed to be completely successful; David with a few followers and his personal guard fled across the Jordan, leaving to Absalom Jerusalem and the main portion of the kingdom. The usurper pursued the fugitives with his forces but was completely defeated in "the wood of Ephraim" (apparently west of Jordan, if the text be right), and killed by Joab, who found him caught by the hair in an oak tree. To the affectionate chivalrous heart of David, the loss of his son, worthless and treacherous as he was, brought grief which more than outweighed his own safety and restoration.

**ABSALON** (*c.* 1128–1201), Danish archbishop and statesman, was born about 1128, the son of Asser Rig of Fjenneslev, at whose castle he and his brother Esbjorn were brought up with the young prince Valdemar, afterward Valdemar I He was sent later to the University of Paris. Absalon first appeared in Saxo's chronicle as a fellow-guest at Roskilde, at the banquet given in 1157 by King Sweyn to his rivals, Canute and Valdemar. Both Absalon and Valdemar narrowly escaped assassination at the hands of their treacherous host on this occasion, but at length escaped to Jutland, where Sweyn followed them, to be defeated and slain at the battle of Grathe Heath.

In the same year (1158) in which Valdemar ascended the Danish throne, Absalon was elected bishop of Roskilde. Henceforth Absalon was the chief counsellor of Valdemar, and the promoter of that imperial policy which, for three generations, was to give Denmark the dominion of the Baltic. Briefly, it was Absalon's intention to clear the northern sea of the Wendish pirates, who inhabited that portion of the Baltic littoral which we now call Pomerania, and ravaged the Danish coast so unmercifully that at the accession of Valdemar one-third of the realm of Denmark lay waste and depopulated. The very existence of Denmark demanded the suppression and conversion of these stiff-necked pagan freebooters, and to this double task Absalon devoted the best part of his life.

The first expedition against the Wends, conducted by Absalon in person, set out in 1160, but it was not till 1168 that the chief Wendish fortress, at Arkona in Rügen, containing the sanctuary of their god Svantevit, was surrendered, the Wends agreeing to accept Danish suzerainty and the Christian religion at the same time. From Arkona Absalon proceeded by sea to Garz, in South Rügen, the political capital of the Wends, and an all but impregnable stronghold But the unexpected fall of Arkona had terrified the garrison, which surrendered unconditionally at the first appearance of the Danish ships Absalon, with only Sweyn, bishop of Aarhus, and 12 "housecarls," thereupon disembarked, passed between a double row of Wendish warriors, 6,000 strong, along the narrow path winding among the morasses, to the gates of the fortress, and, proceeding to the temple of the seven-headed god Rugievit, caused the idol to be hewn down, dragged forth and burned. The whole population of Garz was then baptized, and Absalon laid the foundations of 12 churches in the isle of Rugen.

The destruction of this chief sally-port of the Wendish pirates enabled Absalon to reduce considerably the Danish fleet But he continued to keep a watchful eye over the Baltic, and in 1170 destroyed another pirate stronghold, farther eastward, at Dievenow on the isle of Wollin. Absalon's last military exploit was the annihilation, off Strela (Stralsund), on Whitsunday 1184, of a Pomeranian fleet which had attacked Denmark's vassal, Jaromir of Rugen

He was now only 57, but his strenuous life had aged him, and he was content to resign the command of fleets and armies to younger men, like Duke Valdemar, afterward Valdemar II, and to confine himself to the administration of the empire which his genius had created. The aim of his policy was to free Denmark from the German yoke. It was contrary to his advice and warnings that Valdemar I rendered fealty to the emperor Frederick Barbarossa at Dôle in 1162; and, when, on the accession of Canute V in 1182, an imperial ambassador arrived at Roskilde to receive the homage of the new king, Absalon resolutely withstood him.

"Return to the emperor," cried he, "and tell him that the king of Denmark will in no wise show him obedience or do him homage."

As the archpastor of Denmark, Absalon also rendered his country inestimable services, building churches and monasteries, introducing the religious orders, founding schools and doing his utmost to promote civilization and enlightenment. It was he who held the first Danish synod at Lund in 1167. In 1178 he became archbishop of Lund, but very unwillingly, only the threat of excommunication from the Holy See finally inducing him to accept the pallium. Absalon died on March 21, 1201, at the family monastery of Soro, which he himself had richly embellished and endowed.

Absalon remains one of the most striking and picturesque figures of the middle ages, and was equally great as churchman, statesman and warrior. There can be no doubt that he enjoyed warfare; and his splendid physique and early training had well fitted him for martial exercises. He was the best rider in the army and the best swimmer in the fleet. Yet he was not like the ordinary fighting bishops of the middle ages, whose sole concession to their sacred calling was to avoid the shedding of blood by using a mace in battle instead of a sword. Absalon never neglected his ecclesiastical duties, and even his wars were of the nature of crusades Moreover, all his martial energy notwithstanding, his personality must have been singularly winning; for it is said of him that he left behind not a single enemy, all his opponents having long since been converted by him into friends.

(R. N. B.)

**ABSCESS,** a localized collection of pus in tissue spaces, hollow viscera or body cavities. It is formed as the result of infection with pus-forming (pyogenic) organisms; there is local heat, redness, swelling and pain. The cells die and the centre of the inflammatory mass liquefies to form pus which may break through the wall of the abscess or be emptied by incision. Various names are applied according to the location and the causative organism. The term "cold abscess" designates a localized collection of pus caused by the bacillus of tuberculosis.

(*See* BACTERIAL AND INFECTIOUS DISEASES; INFLAMMATION AND ITS SEQUELS.)

(F. L. A.)

**ABSCISSA.** In Cartesian co-ordinates (*see* CO-ORDINATES) the abscissa of a point ($P$) is the part ($OP'$) of the $X$ axis lying between the origin ($O$) and the point ($P'$) where a line ($PP'$) parallel to the $Y$ axis cuts the $X$ axis In each of the two figures, the line segment $P''P$ is also called the abscissa of $P$. The axis of $X$ ($OX$) is called the axis of abscissas. The term was used in its technical sense by Pietro Mengoli in 1659

**ABSCISSION,** a tearing away, or cutting off; a term used sometimes in prosody for the elision of a vowel before another, and in surgery, especially of the eye, for removal of projections of a diseased cornea; in botany, the separation of spores by elimination of the connection.

**ABSCOND,** to depart in a secret manner, in law, to remove from the jurisdiction of the courts or so to conceal oneself as to avoid their jurisdiction. A person may abscond either for the purpose of avoiding arrest for a crime (*see* ARREST) or for a fraudulent purpose, such as the defrauding of his creditors (*see* BANKRUPTCY).

**ABSENCE,** the fact of being away, either in body or mind. The special occasion roll call at Eton college which the boys attend in their tall hats is called absence. A soldier must get leave of absence before he can be away from his regiment. Seven years' absence with no sign of life either by letter or message is held, by English law, to be presumptive evidence of death

**ABSENTEE OWNERSHIP,** a term to which specialized usage has given different meanings freighted with social and economic implications not inherent in a literal interpretation of the phrase. The earliest such usage identified absentee ownership with proprietors of land who did not reside on their estates, yet demanded and enjoyed incomes from them. This practice, exercised in greater or less degree, has probably always existed where there was private ownership of land Classical writers mention it. It is present in the history of landholding in Hungary, Poland, Russia and other countries of central and eastern Europe, and in parts of the orient, notably India. But students of western thought and institutions know it best through the criticism levelled at the absentee owners among the court nobility of pre-Revolutionary France (though their significance is somewhat minimized by the increased importance given by modern writers to resident country nobles and peasant proprietors); and in connection with Irish lands in the 19th century.

In the main the practice has met popular disfavour, sometimes on economic, often on social and ethical grounds. The basic assumption was that absentee landlords lacked the personal interest and contact believed conducive to the well-being of a tenant population. But in 19th-century England where charges against absentee English landlords who exploited their Irish tenantry brought the subject into the field of economic theory and speculation, the arguments were not all on one side. Some economists defended the practice, not so much as protagonists, as in denial of its responsibility for many of the ills laid at its door. But it was probably the Land Purchase acts and other remedial measures that led to a lessening of interest in the subject by the end of the century.

The first quarter of the 20th century saw the term carried over into the field of business enterprise and industry. A theory developed chiefly among certain U.S economists held that "captains of industry" who, by means of investments managed through corporate organization and financial combines, kept a controlling influence over industrial prices and output while not themselves participating in industry, were the most powerful absentee owners of modern times Thorstein Veblen, social and economic philosopher who pointed up the possible social ills likely to accrue from this practice, did much to enhance the usage of the term though he was not alone in its propagation.

It was the belief of the Veblen school that the cleavage which had grown up between industrial work and business enterprise was responsible for the absentee feature of this type of ownership. And it was in this division that Veblen saw the possibility of all manner of social ills These would, if and when production should outrun markets, lead to action that would in time bear heavily on the underlying population and others engaged in the working processes of industry. Another practice also described as absentee ownership, though of different origin, was that involving the private ownership of public resources The U.S. exploitation of public lands was a flagrant example These ideas were strongly challenged, and they also had stout defense

**ABSENTEE VOTING, U.S.** was first provided for by state legislation during the Civil War, when 11 Union states permitted men on leave for military duty to vote in the federal election by absentee ballot or by proxy. There were then about 2,000,000 men under arms, of whom about 150,000 voted But although more than three-fourths of the soldiers voted for the re-election of their commander in chief, Pres Abraham Lincoln, their total vote scarcely affected the general outcome

In 1896 a law was passed in Vermont inaugurating the use of the absentee ballot by civilians and five years later a similar measure was passed in Kansas By 1917 citizens of 28 states had acquired the privilege and in 1942 all states except Delaware, Kentucky and New Mexico had absentee voting laws of one kind or another. Legal bases for absentee voting included such duties, businesses or occupations as those of commercial travellers, railroad and marine employees, federal employees and their wives, college and university students and faculties, actors, inmates of veterans' homes and hospitals and members of the regular army. Not all laws, however, were equally comprehensive nor did all apply to military personnel.

There was relatively little interest in the soldier vote during the Spanish-American War or World War I. During the latter, some legislation was discussed, but no action was taken and the war department announced that there would be no voting overseas. It did, however, co-operate with those states which provided machinery for absentee voting within the U.S.

Less than a year after the U.S. entry into World War II, the nation approached the congressional elections of 1942 with an armed force of about 5,500,000 at home and abroad. In an effort to simplify matters for absent soldiers, congress passed a Soldiers Vote law on Sept 16. Mailing of request cards for state ballots was undertaken by the war department and personal registration as well as the poll tax requirements of eight states (Ala., Ark., Ga., Miss., S.C., Tenn., Tex. and Va.) were waived. Nevertheless, the law proved inadequate and of the more than 100,000 who requested ballots, only 28,051 received them and returned them in accordance with their various state law requirements. Efforts to secure more effective legislation were renewed in 1943.

By 1944 there were an estimated 9,225,000 service men and women of voting age scattered throughout the world and a method of ensuring them the vote became a point of controversy between the president and congress. The constitution leaves the qualifications of voters and the machinery for voting (except as modified by the 14th, 15th and 19th amendments) to the various states. Pres. Franklin D. Roosevelt advocated a short federal ballot to which objections were raised on both political and constitutional grounds. First, the Roosevelt-Dewey election promised to be a close contest and the Republicans feared that the great majority of soldiers would vote for their commander in chief, throwing the margin of victory to the Democrats. Second, in spite of the 1942 law, many of the states (especially in the south) protested anew against the encroachment on their traditional rights, since a federal ballot would enfranchise thousands who could not qualify under state laws and requirements such as the poll tax.

Many bills were debated and at last a compromise was arrived at (though not signed by the president who protested its limited character) which became law on March 31. It provided for a short federal ballot for citizens of such states as approved its use, and then, only if the soldier had applied for a state ballot by Sept. 1 and had not received it by Oct. 1. Those eligible in-

cluded members of the army, the navy, the merchant marine and civilian personnel overseas who were in the service of the government or attached to service units, such as members of the Red Cross, the U.S.O., etc. The law called for the creation of a War Ballot commission composed of the secretary of war, the secretary of the navy and the administrator of the War Shipping administration. This body was charged with the printing, distribution and collection of absentee ballots and the mailing of postcard requests for ballots

Twenty states approved the federal ballot, namely: Calif., Conn., Fla., Ga , Me., Md., Mass , Mich., Neb., N H., N J., N M., N C., Okla., Ore , R I , Tex., Utah, Vt and Wash. Use of the federal ballot within the U.S was limited by the law to voters of such states as provided no machinery for absentee soldier voting, but as all 48 states had made such provision by Nov. 1944, the short federal ballot was in effect available only to overseas personnel. Blank ballots were distributed by the War Ballot commission with space for writing in the name or party of candidates for president, vice-president and members of congress. About 4,400,000 absentee ballots, state and federal, were cast by military personnel at home and abroad. In the seven states where data was tabulated separately for civilian and soldier vote the results showed that, despite earlier forecasts, the vote was approximately as close in one category as in the other.

**ABSINTHE,** a highly toxic liqueur or aromatized spirit, the characteristic flavouring matter of which is derived from various species of wormwood (*Artemisia absinthium*). Among the other substances generally employed in its manufacture are angelica root, sweet flag, dittany leaves, star-anise fruit, fennel and hyssop. The Swiss variety has a higher alcoholic strength than the French. The best absinthe contains 70% to 80% of alcohol. It quickly intoxicates, and its deleterious effects are more serious than those of other forms of alcohol. The wormwood acts powerfully upon the nerve centres, and causes delirium and hallucinations, followed in some cases by idiocy. (*See* LIQUEURS.)

**ABSOLUTE.** The term absolute is frequently used in contrast with the terms relative, comparative, conditioned, etc.

**Absolute and Relative, Etc.**—(1) Sometimes the contrast intended is that between what expresses a relationship and what does not. In logic, for instance, a term is described as relative when its function is to indicate some definite relationship in which the object named stands to some other object denoted by the correlative term. Thus teacher is called a relative term because it indicates the relationship in which somebody, say Socrates, stands or stood to somebody else, for instance, Plato, who is consequently designated by the correlative term disciple, or pupil. But a term that indicates no relationship is called absolute. Thus the names Socrates and Plato are called absolute terms because they do not indicate any definite relationship in which Socrates and Plato stood to each other. (2) More commonly the contrast intended is that between what a thing is relatively to something else (or in comparison with certain other things) and what it is in itself (that is, apart from such comparisons), or absolutely. In this sense one sometimes contrasts what is relatively or approximately true with what is absolutely true, or what is comparatively beautiful, or large, or old, etc., with what is absolutely so. (3) Intimately connected with the preceding distinction between absolute and relative, etc., is yet another distinction, which is perhaps the commonest of all. This is the contrast between what is subject to certain reservations or conditions and what is not subject to conditions or reservations. Thus, for example, relative success may mean success under certain difficult circumstances, while absolute success would mean complete success, without any reservations. In this way absolute monarchy means monarchical government not subject to any conditions or reservations, whereas constitutional monarchy means monarchical government subject to certain reservations or restrictions formulated in the constitution of the country. Similarly a system of ethics conceived to be valid for all times under all conditions would be described (by H. Spencer, for instance) as absolute, whereas a system of ethics conceived to be valid only under certain conditions of time, place or circumstance, would be called relative, or local, or temporary, etc (4) The foregoing distinction naturally leads to yet another distinction; namely, that between that which is conditioned by, or dependent on, something else and that which is independent of, or unconditioned by, anything else. In philosophy, absolute [illegible] means independent or unconditioned When certain philosophers speak of absolute truth, or of absolute value, they mean that there are truths, or values, as the case may be, that are objective, independent or self-dependent, and not relative to, or dependent upon, individual thinkers or seekers.

**The Absolute.**—This term owes its great vogue in recent times mainly to the German Idealists (Immanuel von Fichte, Friedrich von Schelling, Georg Hegel, etc.) and their followers. But the main idea which it expresses is already found in Plato; and both the idea and the term were familiar to Thomas Aquinas, Giordano Bruno, Benedictus de Spinoza, and many others, long before the period of German Idealism. The use of the term is intimately connected with the last of the above-mentioned applications of the term absolute (4). Spinoza describes substance (that is, nature, God or the universe) as absolutely infinite, in contrast with its ultimate attributes, which are infinite each in its kind only; and absolutely infinite substance is conceived by Spinoza as the self-existing, independent, unconditional ground of all that is It is the ultimate ground of all reality that is always, or nearly always, meant by the Absolute. But different systems of philosophy hold out different views as regards both the reality and the nature of the Absolute. In Vaihinger's *Philosophy of "As If,"* the Absolute is a fiction. For Hamilton, Henry Mansel and Herbert Spencer the Absolute is the unknown; for Immanuel Kant the Absolute (or Noumenon) is even unknowable. Theists identify the Absolute with God; pantheists. with the universe; Arthur Schopenhauer and Wilhelm Wundt, with will; Henri Bergson. with a life force characterized by creative evolution; Gustav Fechner and Lipsius, with consciousness; Francis Bradley, with experience; Joel, with the potentiality of all that is real; Rudolf Lotze and Josiah Royce, with self-conscious personality; Alexander, presumably with the space-time matrix of all reality. Hegel, whose philosophy is most intimately connected with the conception of the Absolute, identified it with the universal spirit, which by a process of logical or dialectical development takes on one predicate after another until it manifests itself as an objective world in perfect harmony with reason.

BIBLIOGRAPHY.—Histories of philosophy by Benno Erdmann, Wilhelm Windelband, etc., the works of Mrs. Bradley and the other philosophers referred to in the text (A. Wo.)

**ABSOLUTE DIFFERENTIAL CALCULUS:** *see* TENSOR ANALYSIS

**ABSOLUTE MUSIC,** a term applied to music of a purely abstract type, devoid of any nonmusical or extra-musical significance, as distinguished from that of the pictorial or descriptive kind known as "programme music" (*q.v.*).

**ABSOLUTE PITCH,** in the language of the physicist, is the position of a tone as determined by its rate of vibration. Among musicians, it signifies that sense, or form of memory, which enables a person to recognize or reproduce any musical tone, as an A or C♯. In this sense, the term is used in contradistinction to relative pitch which concerns itself, for example, with the tonic or the dominant within a given key. The possession of absolute pitch is not considered essential for fine musicianship; notable among composers who were without absolute pitch were Robert Schumann and Richard Wagner. (*See* also PITCH, MUSICAL.)

**ABSOLUTE TEMPERATURE SCALE,** the scale of temperature based on thermodynamics (*q.v.*), also called the Kelvin scale after Lord Kelvin (*q.v.*). The temperature scale derived from the law of expansion of a perfect gas, is identical with this thermodynamical scale. The usual abbreviations for absolute scale are abs., A. or K. Comparing it (approximately) with the centigrade scale, 0° C.=273° A., 100° C.=373° A., thus absolute zero is equivalent to −273° C. (*See* THERMODYNAMICS and THERMOMETRY.)

**ABSOLUTE UNITS,** units of measurement of a physical quantity in terms of the fundamental units of length, mass and

time; the British association selected, as their fundamental units, the centimetre, the gram and the second of mean solar time, and thus formed the C.G.S. system of units. (*See* PHYSICAL UNITS.)

**ABSOLUTION** (religious) denotes the setting of the penitent sinner free from the guilt of his sin, or from the ecclesiastical penalty (excommunication), or from both The authority of the church or its minister to pronounce or refuse forgiveness is implied in II Cor. ii, 5–11, and Acts v, 1–9 (*cf.* James v, 15, 16), and was derived from the tradition of our Lord's teaching; *see* John xx, 23 (in Matt xviii, 18, binding and loosing probably mean forbidding and allowing). In primitive times, when confession of sins was made before the congregation, the absolution was deferred till the penance was completed; and there is no record of the use of any special formula. The penitent was reconciled by imposition of hands by the bishop, with or without the clergy Later the office was usually discharged by priests, and the outward action more and more disused. It became the custom to give the absolution to penitents immediately after their confession and before the penance was performed. Until the middle ages the form of absolution after private confession was of the nature of a prayer, such as "May the Lord absolve thee"; and this is still the practice of the Greek church. But about the 13th century the Roman formula was altered, and the Council of Trent (1551) declared that the form and power of the absolution lay in the words *Ego te absolvo,* etc , and that the accompanying prayers are not essential to it. Of the three forms of absolution in the Anglican Prayer Book, that in the Visitation of the Sick (disused in the church of Ireland and in the United States) runs "I absolve thee," tracing the authority so to act through the church up to Christ: the form in the Communion Service is precative, while that in Morning and Evening Prayer is indicative indeed, but so general as not to imply a decree of absolution.

(W. O. B )

In civil law absolution signifies the acquittal of an accused person on the ground that the evidence has either disproved or failed to prove the charge against him. The term is now little used, except in Scottish law in the forms *assoilzie* and *absolvitor.*

**ABSOLUTISM.** The term absolutism is generally applied to any view or theory that the object under consideration (whatever it may be) is not merely conventional, or subjective, or dependent, or limited in any way, but absolute, that it is real or valid in itself, or objective, or independent, or unrestricted. (*See* ABSOLUTE ) (1) In ethics, absolutism is the view that moral distinctions are not the result of mere arbitrary commands of God, or of human conventions variable according to circumstances, but that they are intrinsically valid, and the same for all human beings, at all times, and in all places. (2) In aesthetics, absolutism is the view that distinctions of beauty and ugliness are not entirely dependent on the subjective feelings of the percipient mind, but that they are objective differences in things themselves, such as the primary qualities of material objects. (*See* QUALITIES ) Absolutism maintains accordingly that aesthetic appreciation should not be regarded as merely a matter of taste about which people must agree to differ (*de gustibus non disputandum*), but that there is an objective or absolute standard of beauty by which aesthetic judgment ought to be guided. The fact that even art specialists are frequently at variance is accounted for by absolutists by the suggestion that individuals vary in their powers of apprehending aesthetic qualities just as they vary in other capacities. (3) In political theory, absolutism denotes a form of government in which the sovereign exercises almost complete power unrestrained by such laws and reservations as characterize what is commonly called constitutional government. (*See* ABSOLUTISM, POLITICAL.)

**ABSOLUTISM, POLITICAL.** In political theory, the term "absolutism" designates a form of government in which the whole power of the state is concentrated in one single individual, the ruler, whose will is the law of the state. All other individuals, members of the community, are subjected to the ruler without participating in his power which for this reason is unlimited and in this sense absolute. For the ruled it means complete lack of individual freedom in the sense of self-determination. It is incompatible with the idea of equality, since justifiable only by the essential difference which is supposed to exist between the ruler and the ruled Political absolutism is synonymous with despotism, dictatorship or autocracy

Its opposite is democracy Here the political power of everybody is necessarily limited by the fact that it must be shared with others and is in this sense relative only In participating in the power of the state, and especially in the creation and application of the law, the individuals are politically free and equal.

In historic reality there is or was no state conforming completely with the type of political absolutism There are only more or less forgoing approximations to this form of government. In the past the most pronounced form of autocracy was the absolute monarchy such as existed in Europe in the 18th century, especially in France under Louis XIV, whose saying, *L'état, c'est moi* (I am the State), is the best-known formulation of its basic idea In the orient, despoties were, during the most diverse periods and among the most diverse peoples, the prevailing political system. In recent times a new form of political absolutism has arisen in the party dictatorship of bolshevism and fascism. In Russia the new form is a product of the socialist revolution that was released by World War I Its intellectual basis is the Marxist theory of class struggle and the dictatorship of the proletariat In reality this dictatorship has become that of a party representing the interests of the proletariat, excluding all other parties, even socialistic ones. The word "bolshevism" was originally applied only to the political creed of the party, which later on exercised dictatorship in Russia; but it has come to designate a type of government In Italy the fascists were a middle-class party that rose to dictatorship in struggle against socialist parties. The word "fascism," like bolshevism, has come to be used as the name for a type of government: the dictatorship of a middle-class party The national socialist state of Germany belonged to this type.

The ruling party in a party dictatorship has itself an autocratic character. Its members are under the absolute rule of the party leader who at the same time is the head of the state. Since bolshevism originally maintained the fiction of a separation of party and state, and further did not have an ideology of "leadership," the leader was for a long time officially the secretary-general of the party only. But in reality there is in this point no essential difference between the two forms of party dictatorship, nor is there an essential difference between so-called party dictatorship and personal dictatorship of an absolute monarch.

Political absolutism corresponds perfectly to philosophical absolutism, meaning by this term the view that there exist absolute values and consequently also absolute truths. The validity of judgments referring to these values is absolute, not relative; objective, not subjective; that is to say, the value judgments are valid, not only relative to, and dependent upon, the judging subject, but for everybody, always and everywhere. Their personal, temporal and territorial spheres of validity are unlimited.

Such a view is possible only under the conscious or unconscious presupposition that there exists an absolute being, unlimited in every respect and, hence, unique. Since value is the function of will, absolute values are conceivable only as emanations of the will of an absolute being. Consequently, the latter must be realized as a supreme normative authority, as the unique and, hence, absolute ruler of the universe. Philosophical absolutism has an immanent tendency toward monotheism.

There is not only perfect parallelism between political and philosophical absolutism; the former has the outspoken inclination to use the latter as an ideological instrument. To justify his unlimited power, the ruler must present himself as directly or indirectly authorized by the only true absolute, the superhuman being, as his descendant or deputy or as inspired by him in a mystical way. Where the political ideology of an autocratic government does not permit recourse to the absolute of an historical religion, as in the case of bolshevism, it assumes itself a more or less religious character by absolutizing its basic value,

the idea of socialism.

Less obvious, but nevertheless not less true, is the parallelism which exists between the opposite of political absolutism—democratism, and the opposite of philosophical absolutism—relativism. To determine the contents of a social order, not according to what is really best for the individuals subject to this order, but according to what these individuals, or their majority, rightly or wrongly believe to be best for them—this consequence of the democratic principle of liberty and equality is justifiable only if there is no absolute answer to the question as to what is the best. It is justifiable only if there is no such thing as an absolute Good (to use a term of Plato, the classical representative of philosophical absolutism and passionate opponent of democracy), or if God, and not (as the democratic sophists said) man, is the measure of all things To let the ignorant majority decide, instead of the only one who by virtue of his divine origin or inspiration has the exclusive knowledge of the absolute Good, is not the most absurd method when it is believed that such knowledge is impossible and that, consequently, no single individual has the exclusive right to enforce his will upon the others In claiming that judgments of value have only relative validity, the basic principle of philosophical relativism implies that opposite value judgments are neither logically nor morally impossible. It is one of the fundamental principles of democracy that everybody has to respect the political opinion of everybody else, since all are equal and free. Tolerance, minority rights, freedom of opinion, freedom of thought, so characteristic of democracy, have no place within a political system based on the belief in absolute values This belief irresistibly leads, and always has led, to a situation in which the one who is supposed to possess the secret of the absolute Good claims to have the right to impose his opinion as well as his will upon the others who are in error, and to be in error is, according to this view, to be wrong. If, however, it is recognized that only relative values are accessible to human knowledge and human will, then it is justifiable to enforce a social order against reluctant individuals only if this order is in harmony with the will of the greatest possible number of equal individuals; that is to say, with the will of the majority. However, it may be that the minority and not the majority is right. Solely because of this possibility (which only philosophical relativism can admit) that what is right today may be wrong tomorrow, the minority must have the chance of expressing freely its opinion and have full opportunity of becoming the majority.

This is the true meaning of that political system which is called democracy, and which may be opposed to political absolutism only because it is political relativism. (H. KN.)

**ABSORPTION OF LIGHT IN SPACE.** This term is used to designate any interference with the propagation of light while it travels through interstellar space.

The possibility that the light of distant stars might be dimmed by absorption on its long path to the earth was mentioned as early as 1720 by Edmund Halley and was discussed by Heinrich Wilhelm Matthias Olbers, Friedrich Georg Wilhelm Struve, Hugo von Seeliger and others during the 19th century. No real evidence of its existence was obtained before the second quarter of the 20th century; after 1930, however, information on this subject accumulated with surprising rapidity.

The earlier studies took it for granted that such absorption, if it existed, would be universal or uniform, and this erroneous expectation has undoubtedly retarded the discovery. The actual observational data show that absorption of light in space is caused by interstellar matter, highly rarefied nebulous matter, irregularly spread between the stars through certain parts of our stellar system while in other parts of the universe the transparency of space is practically perfect. The problem of space absorption is thus intimately related to that of nebulae and interstellar matter; it forms the main avenue of approach to the investigation of the latter.

The observed phenomena of interstellar absorption and the knowledge of interstellar matter gained therefrom will be presented under the following headings: (1) general absorption, (2) change of colour by absorption, (3) interstellar spectral lines, (4) nature and distribution of interstellar matter

**General Absorption.**—The light radiated by a star spreads in all directions, and in a perfectly transparent space the star's apparent brightness must be inversely proportional to the square of its distance from the observer; but if the light suffers an absorption in space the apparent brightness decreases more rapidly with distance than by the inverse square law A loss of light by interstellar absorption may thus be detected if, in addition to the apparent brightness of a star, we can also determine its distance and its true luminosity (brightness when seen at unit distance) The last two data, however, are difficult to obtain for stars sufficiently far away to show an appreciable absorption effect

The first successful test of this kind was made by R J Trumpler in 1930 in a study of galactic star clusters The angular diameter of each of these star groups furnished an estimate of its distance, while the luminosities of its stars could be inferred from their spectra. In the more distant clusters (5,000 to 15,000 light years) the observed brightness of the cluster stars was found considerably less than that calculated by the inverse square law. Over a distance of 10,000 light years the loss of light (photographic) by space absorption was on the average about 2 magnitudes or 84%. A similar result was later obtained by A. Joy and R. E Wilson from a study of faint Cepheid variables.

The existence of local absorption effects in the Milky Way had already been recognized by E E Barnard and M Wolf at the end of the last century. Their excellent Milky Way photographs revealed numerous dark, nearly starless patches in the midst of densely crowded star fields. They interpreted these formations as dark nebulae—local clouds of absorbing matter which obscure the stars behind them. When the numbers of stars of different magnitudes are counted in the obscured region and in the surrounding normal star field, the distance and absorption of the cloud can be found by statistical analysis Several of the most conspicuous dark clouds have been investigated by this method and all evidence seems to indicate that they are merely local concentrations in the general stratum of interstellar matter.

**Change of Colour by Absorption.**—The sun appears red when it is near the horizon before sunset because its blue light of short wave lengths has been mostly lost by scattering in the earth's atmosphere, while the longer waves of red light have been more readily transmitted. In a similar way, if absorption of light in space affects some colours or wave lengths more than others, the colour (or mixture of colours) of distant stars will be changed

Since a star radiates very nearly like a perfect radiator (black body), its true colour is determined by the temperature of its luminous surface. The latter can be estimated rather closely from the spectral class, that is from the intensities of the various dark absorption lines in its spectrum. The difference between the observed colour of a star and its true colour as inferred from its spectral class is called the colour excess. Extensive studies of colour excess in galactic star clusters and of high temperature stars show conclusively that distant stars in the Milky Way are considerably reddened by interstellar absorption, and that the latter is nearly inversely proportional to the wave length According to physical theory a loss of light of this kind is produced when light is scattered by small solid particles. Interstellar space seems to be permeated by a thin haze of fine cosmic dust.

**Interstellar Spectral Lines.**—When the light of a star is spread by the spectroscope into a continuous band of rainbow colours, this band is found to be interrupted by numerous dark lines. Such spectral lines are due to absorption of certain wave lengths by the atoms or molecules of any gases through which the light emitted by the star's luminous surface passes before reaching the observer.

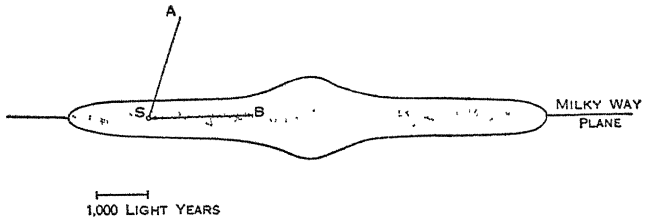
Most of the lines observed in stellar spectra originate in the atmosphere of the star (star lines), a few in the earth's atmosphere (telluric lines), and some, according to recent evidence, are absorbed on the passage of the light through space between the star and the earth (interstellar lines). The existence of these latter lines proves that interstellar matter also contains free atoms and molecules, and these may be said to form an extremely rare-

fied interstellar gas

The main difficulty is that of distinguishing interstellar lines from star lines. This is possible, for instance, in the case of binary systems where two stars are rapidly revolving around their centre of gravity. The star lines in the spectrum of one of these stars will be alternately shifted toward the violet and the red end of the spectrum (Doppler shift) as the star approaches or recedes from the observer Interstellar matter, of course, takes no part in such orbital motion and its lines remain stationary

In general, interstellar lines may also be recognized by the fact that they are stronger in the spectra of distant Milky Way stars than in the spectra of relatively near stars of the same spectral class

The most important interstellar lines identified are those due to atoms of calcium, sodium, potassium, titanium, iron and to the molecules CH and CN. It is, however, probable that most of the common elements as well as free electrons are contained in the interstellar gas although some of the constituents do not reveal their presence as readily as others



**Nature and Distribution of Interstellar Matter.**—The observed effects of space absorption lead to the conclusion that the space between the stars is not completely empty but contains some matter consisting of small solid particles as well as atoms and molecules.

The solid particles may be of various sizes, but those which produce most of the scattering must be very small with diameters of 0 1 to 10 microns (25,000 microns = 1 in ). Nothing is known about their chemical composition except that they are probably nonmetallic.

It is difficult to give an adequate idea of the extremely rarefied state of interstellar matter. On the average, one cubic mile of such matter would weigh less than $\frac{1}{100,000,000}$ gr ; it would contain a few hundred microscopic dust particles and about as many molecules and atoms as are found in $\frac{1}{100,000}$ cu.cm. of air. The space between the stars, however, is so large that the total mass of interstellar matter is probably not much less than the mass contained in the stars. Perhaps these interstellar particles are debris lost by the stars; perhaps they constitute the primordial matter from which stars are born. In any case they form an important feature of our stellar system and in many of the external galaxies the presence of such dark matter is also quite noticeable.

The general distribution of interstellar matter in relation to our stellar system is illustrated in the figure. This system is of a highly flattened shape somewhat like a circular disk or lens, and the plane of this disk is outlined on the celestial sphere by the circle of the Milky Way. Interstellar matter seems to be confined to a relatively thin layer stretching along the central plane of the system. Outside of this layer we find practically no absorbing matter and the vast spaces between our system and other galaxies appear to be of perfect transparency.

When observing from the solar system S (fig ) in the direction A, at a considerable angle from the Milky Way, the line of sight has only a short path through the absorbing layer, and we can see very distant objects such as external galaxies with little interference. In the direction of the Milky Way (direction B), the light from distant stars is obstructed all along its way and shows heavy absorption effects. This peculiar arrangement of the absorbing medium has the consequence that we can see external galaxies millions of light years away while large parts of our own stellar system are obscured from our view and we have so far not even been able to penetrate to the centre of our galaxy.

SPACE DISTRIBUTION OF INTERSTELLAR MATTER

The full line shows a cross cut through the lens-shaped system containing the stars; the position of our sun is marked by S. The dotted area indicates the region where highly rarefied cosmic dust and interstellar gas are irregularly spread between the stars. Outside of this layer, space is of practically perfect transparency

The distribution of interstellar matter through this general layer, however, is extremely irregular. The cosmic dust seems to have the tendency to accumulate in numerous local clouds large or small with concentrations sometimes exceeding ten times the average How closely the distribution of the interstellar gas follows the irregularities of the cosmic dust is as yet uncertain.

While on the one hand absorption of light in space is an important source of information concerning interstellar matter, it is on the other hand a serious obstacle in any attempt to map the structural features of our stellar system by statistical studies of star distribution. The technique of taking photographs by red or infra-red light, less subject to scattering by cosmic dust, may, however, offer a means for penetrating to the more distant parts of our galaxy.

Aller, *Atoms, Stars and Nebulae* (1943) (chapter 10 of this book gives a popular account of interstellar matter). (R. J TR)

**ABSORPTION SPECTRUM:** *see* BAND SPECTRUM; LIGHT; QUANTUM MECHANICS; SPECTROSCOPY.

**ABSTEMII,** a name formerly given to such persons as could not partake of the cup of the Eucharist on account of their aversion to wine (Lat. *abs,* "away from"; *temetum,* "intoxicants"). In modern times many total abstainers, holding that the use of intoxicants is to be condemned absolutely, communicate in the unfermented "juice of the grape," sometimes also alleging that the wine used by Christ and his disciples at the Last Supper was unfermented.

**ABSTINENCE,** the fact or habit of refraining from anything, usually from indulgence of the appetite. A "total abstainer" is one who takes the pledge to abstain from alcoholic liquor (*see* TEMPERANCE). Abstinence in the Christian Church is a moderate form of fasting (*q.v.*).

"Abstinence" was also a term in economics, now fallen into disuse, applied to the postponement or sacrifice of present satisfaction for the sake of future gain.

It remains true that no person will save except for the purpose of securing some future advantage for himself or for others. As Frank Taussig puts it, "present resources will not be cancelled for future resources unless some inducement be offered." This is true equally of individual or of communal saving; thus, a Collectivist or Socialist government could only provide capital for the prosecution of industry or for future social satisfactions by drafts upon current income, *i.e.,* by performing an act of national abstinence. (*See* ECONOMICS.)

**ABSTRACT** and **ABSTRACTION.** The term abstract is sometimes used as a noun to denote a summary or digest of a document. Such an abstract is usually obtained by selecting what is essential and omitting the rest. Speaking generally, the process of abstraction is usually a process of selection of some part or aspect of a complex whole, and of consequent neglect of the rest. The result of such a process of "withdrawal" (in the twofold sense of selecting a part and neglecting the rest) is commonly described as abstract.

In logic, *e g.,* abstract terms are distinguished from concrete terms, the latter denote objects consisting of a whole complex of attributes and standing in various relations, whereas the former designate some quality or relation isolated or abstracted from its concrete context. For instance, "motor" and "relative" are concrete terms, whereas "motion" and "relationship" are abstract terms. But there are degrees of abstraction—the selection may be less or more restricted, and the consequent neglect more or less extensive. This may be readily seen if one passes in review such a series of terms as, say, "the horse that won the Derby in 1927," "race horse," "horse," "quadruped," "animal," "life." Of these terms only the last would be called abstract, but really all the

terms in the series except the first are obtained by abstraction. In fact all general terms, or common nouns, are the result of abstraction. That is why some of the earlier logicians and psychologists applied the epithet *abstract* to what are now usually called general concrete terms It is just a matter of convenience and convention that only the more abstract terms are now called *abstract,* the less abstract terms being called *general*

In the past too much stress used to be laid on the negative side of abstraction; that is, on the mere neglect of certain parts or aspects of the concrete whole. It is now realized more fully that the process is mainly positive in character. It is a process of positive selection, not merely one of omission, though of course it involves omission.

The relative stress on the positive and the negative sides of the process of abstraction really varies considerably. When the process is merely spontaneous, or not deliberate, the negative character of abstraction is probably more prominent; when it is deliberate (that is, a process of voluntary attention), the positive phase is the more marked.

Abstraction is of great importance for all real knowledge, especially for science and philosophy. The aim of all scientific knowledge is the discovery of laws expressing the relation or correlation between various aspects of reality, such as mass and gravitation, volume and pressure or temperature and volume; and it is by processes of abstraction that these phases of reality are isolated and followed up (A. Wo.)

**ABSTRACT OF TITLE,** in law, a digest or epitome of the various instruments and events under, and in consequence of, which the vendor or mortgagor of an estate derives his title thereto. The system of registration has much affected the necessity for this abstract's being prepared or used. (*See* also LAWS RELATING TO REAL PROPERTY AND CONVEYANCING )

**ABT, FRANZ** (1819–1885), German composer, was born at Eilenburg, Saxony, and died at Wiesbaden. His songs and part-songs enjoyed an extraordinary vogue throughout the world in the middle of the 19th century, and are still popular.

Abt was kapellmeister at Bernburg in 1841, at Zurich in the same year and at Brunswick from 1852 to 1882, when he retired to Wiesbaden.

**ABU,** a mountain of central India, situated within the Rajputana state of Sirohi. It is an isolated peak of the Aravalli range, being completely detached from that chain by a narrow valley 7 mi. across, in which flows the western Banas. It rises from the surrounding plains of Marwar like a precipitous granite island, its various points ranging from 4,000 to 5,646 ft. The elevations and platforms of the mountain are covered with elaborately sculptured shrines, temples and tombs. On the top of the hill is a small round platform containing a cavern, with a block of granite, bearing the impression of the feet of Data-Bhrigu, an incarnation of Vishnu.

The two principal temples, at Dilwarra, about the middle of the mountain, are built of white marble, and are pre-eminent alike for their beauty and as typical specimens of Jain architecture in India.

The more modern of the two was built by two brothers, rich merchants, between the years 1197 and 1247, and for delicacy of carving and minute beauty of detail stands almost unrivalled, even in that land of patient and lavish labour.

The other was built by Vimala, a local governor, apparently about A.D. 1032; simpler and bolder in style, it is one of the oldest, as well as one of the most complete, examples of Jain architecture known. The principal object within the temple is a cell lighted only from the door, containing a cross-legged seated figure of the god Parswanath The portico is composed of 48 pillars, the whole enclosed in an oblong courtyard about 140 ft. by 90 ft., surrounded by a double colonnade of smaller pillars, forming porticos to a range of 52 cells, each of which is occupied by an image of Parswanath.

The whole interior is magnificently ornamented.

Abu was the summer residence of the governor-general's agent for Rajputana, and is a place of resort for Europeans in hot weather. The annual mean temperature is about 70°, rising to 90° in April; but the heat is never oppressive. The annual rainfall is about 68 in.

**ABU BEKR,** properly ABU BAKR (*c.* 573–634), the first of the Mohammedan caliphs (*see* CALIPHATE), the son of Abu Kohāfa, of the Taim clan of the tribe of Quraish at Mecca. His original name is unknown, since on conversion to Islam he took the name of 'Abdullah. *Abu Bekr* ("father of the camel-foal") is an epithet, also of unknown origin and sometimes mistakenly rendered "father of the virgin" (*bikr*), in reference to his daughter Ayesha (A'isha), the young wife of the prophet Mohammed. He was one of the earliest of Mohammed's converts and spent the considerable wealth which he had acquired by trade in the service of the new religion and in ransoming slaves. His firm belief in Mohammed and his teachings won for him the appellation of al-Siddīk ("the faithful") In his personal relationship to the prophet he showed the deepest veneration and unswerving devotion. When Mohammed fled from Mecca to Medina (622), Abu Bekr was his sole companion; and Abu Bekr remained constantly with him till his death. During his last illness the prophet indicated Abu Bekr as his successor by appointing the latter to lead the congregation in public prayers.

The choice was ratified by the chief companions of the prophet at Medina and ultimately confirmed, although it was disputed by Ali, Mohammed's son-in-law. After a time Ali submitted, but the difference gave rise to the controversy which divides Moslems into Sunnites and Shi'ites, the latter supporting the claims of Ali.

Abu Bekr had scarcely assumed his new position (632), under the title of *khalīfat rasūl-illāh* ("successor of the apostle of God") when he was called to suppress a rising of the tribesmen of Hejaz and Nejd against the political control of Medina and the payment of *zakat* ("almstax," or tribute). The troops of Medina encountered strong opposition from several quarters but defeated the rebels in a series of engagements, the severest struggle being that with the "false prophet" Mosailima in Nejd, who was finally overcome by Khālid in the battle of Akraba. The reconverted tribesmen were called up to join the expeditions into Iraq under Khālid and toward Palestine and Syria under different commanders. After the hard-won victory over Mosailima, Omar, fearing that Mohammed's revelations might be forgotten when those who had heard them were removed by death, induced Abu Bekr to put them into a written form The completed record was deposited with Omar's daughter Hafsa (one of the wives of Mohammed) and furnished most of the materials out of which the Koran was prepared. Abu Bekr died on Aug. 23, 634, probably from natural causes although one tradition speaks of poison. He is said to have indicated Omar as his successor.

*See* Sir W Muir, *The Caliphate,* rev. ed. (Edinburgh, 1924); L. Caetani, duke of Sermoneta, *Annali dell' Islam,* vol. ii and iii (Milan, 1907–10). (H. A. R G.)

**ABU HAMED,** a town of the Anglo-Egyptian Sudan on the right bank of the Nile, 345 mi. by rail N. of Khartum, and near the head of the fourth cataract. It stands at the centre of the great S-shaped bend of the Nile, and from it the railway to Wadi Halfa strikes straight across the Nubian desert, a little west of the old caravan route to Korosko. A branch railway, 138 mi. long from Abu Hamed, goes down the right bank of the Nile to Kareima in the Dongola district.

The town is named after a celebrated sheikh buried there, by whose tomb travellers crossing the desert formerly used to deposit all superfluous goods, the sanctity of the saint's tomb ensuring their safety.

During the advance on Khartum in 1897, a sharp action was fought there, the troops under Gen. George Hunter routing the Dervishes (Aug. 7, 1897).

**ABŪ HANĪFA AN-NU'MAN IBN THABIT,** Mohammedan canon lawyer, was born at Kufa in A.H. 80 (A.D. 699) of non-Arab, and probably Persian, parentage. Few events of his life are known to us with any certainty. He was a rich silk-dealer, lectured at Kufa upon canon law (*fiqh*) and was a consulting lawyer (*mufti*), but refused steadily to take any public post. When al-Mansūr, however, was building Baghdad (145–149) Abū Hanīfa was one of the four overseers whom he appointed over the crafts-

men. In A.H. 150 (A.D. 767) he died there. A persistent but apparently later tradition asserts that he died in prison after a severe beating, because he refused to obey al-Mansūr's command to act as a judge (cadi, *qādi*). This was to avoid a responsibility for which he felt unfit—a frequent attitude of more pious Muslims.

For many personal anecdotes *see* de Slane's transl of Ibn Khallikan iii. 555 ff., iv. 272 ff. He was buried in eastern Baghdad, where his tomb still exists, one of the few surviving sites from the time of al-Mansūr, the founder.

*See* C Brockelmann, *Geschichte,* i, 169 ff , Nawawi's *Biogr. Dict.* pp 698–770; Ibn Hajar al-Haitami's *Biography,* publ. Cairo, A.H 1304; legal bibliography under ISLAMIC LAW.

**ABU KLEA,** a halting-place for caravans in the Bayuda desert, Anglo-Egyptian Sudan. It is on the road from Merawi to Metemma and 20m. north of the Nile at the last-mentioned place. Near this spot, on Jan. 17, 1885, a British force marching to the relief of Gen. Gordon at Khartum was attacked by a greatly superior force of Mahdists, who were repulsed On the 19th, when the British force was nearer Metemma, the Mahdists renewed the attack, again unsuccessfully. Sir Herbert Stewart, the commander of the British force, was mortally wounded on the 19th, and among the killed on the 17th was Col F G Burnaby.

**ABU-L-'ALA UL-MA'ARRI** (973–1057), Arabian poet and letter-writer, belonged to the South Arabian tribe Tanukh, a part of which had migrated to Syria before the time of Islam. He was born in 973 at Ma'arrat un-Nu'mān in Syria. In 1007 he visited Baghdad, where he was admitted to literary circles, recited in the academies and mosques, and made the acquaintance of men to whom he addressed some of his letters later. In 1009 he returned to Ma'arra, where he spent the rest of his life in teaching and writing

Of his works the chief are two collections of his poetry and two of his letters. The earlier poems up to 1029 have been published in Bulaq (1869), Beirūt (1884) and Cairo (1886), under the title of *Saqt uz-Zand.* The poems of the second collection, known as the *Luzūm ma lam yalzam,* or the *Luzūmiyyāt,* are written with the difficult rhyme in two consonants instead of one, and contain the more original, mature, and somewhat pessimistic thoughts of the author on mutability, virtue, death, etc. They have been published in Bombay (1886) and Cairo (1889).

BIBLIOGRAPHY.—The letters on various literary and social subjects were published with commentary by Shain Effendi in Beirūt (1894), and with English translation, etc., by Prof. D. S. Margoliouth in Oxford (1898). A second collection of letters, known as the *Risālat-ul-Ghufrān,* was summarized and partially translated by R. A. Nicholson in the *Journal of the Royal Asiatic Society* (1900, pp. 637 ff.; 1902, pp. 75 ff., 337 ff., 813 ff ). C Rieu, *De Abu-l-'Alae Poetae Arabici vita et carminibus* (Bonn, 1843); A. von Kremer, *Über die philosophischen Gedichte des Abu-l-'Ala* (Vienna, 1888); *cf.* also the same writer's articles in the *Zeitschrift der deutschen morgenländischen Gesellschaft* (vols. xxix., xxx., xxxi. and xxxviii.). Some of his poems are translated by H. Baerlein in the *Diwan of Abu-l-'Ala* ("The Wisdom of the East" Series, 1908). For his life see the introduction to D. S. Margoliouth's edition of the letters, supplemented by the same writer's articles "Abu-l-'Ala al-Ma'arri's Correspondence on Vegetarianism" in the *Journal of the Royal Asiatic Society* (1902, pp. 289 ff.).

**ABU-L-'ATAHIYA** (Abū Ishāq Ismā'īl ibn Qāsim al-'Anazī) (748–828), Arabian poet, was born at 'Ain ut-Tamar in the Hejāz near Medina. His ancestors were of the tribe of 'Anaza. His life was spent in Kufa and in Baghdad, where he died in 828 in the reign of al-Ma'mūn. The poetry of Abū-l-'Atāhiya is notable for its avoidance of the artificiality almost universal in his days. The older poetry of the desert had been constantly imitated up to this time, although it was not natural to town life. Abū-l-'Atāhiya was one of the first to drop the old qasīda (elegy) form. He is one of the earliest philosophic poets of the Arabs. Much of his poetry is concerned with the observation of common life and morality, and sometimes is pessimistic. Naturally, in the circumstances, he was strongly suspected of heresy

His poems (*Diwān*) with life from Arabian sources have been published at the Jesuit Press in Beirūt (1887, 2nd ed. 1888). On his position in Arabic literature *see* W. Ahlwardt, *Diwān des Abu Nowas* pp. 21 *et seq.* (Greifswald, 1861); A. von Kremer, *Culturgeschichte des Orients,* vol. ii. pp. 372 ff. (Wien, 1877).

**ABULFARAJ** (Abū-l-Faraj 'Alī ibn ul-Husain ul-Isfahani) (897–967), Arabian scholar, was a member of the tribe of the Quraish (Koreish) and a direct descendant of Marwān, the last of the Omayyad caliphs. He was thus connected with the Omayyad rulers in Spain, and seems to have kept up a correspondence with them and to have sent them some of his works. He was born in Isfahān, but spent his youth and made his early studies in Baghdad. He became famous for his knowledge of early Arabian antiquities His later life was spent in various parts of the Muslim world, in Aleppo with Saif-ud-Daula (to whom he dedicated the *Book of Songs*), in Rai with the Buyid vizier ibn 'Abbād and elsewhere. In his last years he lost his reason. In religion he was a Shiite Although he wrote poetry, also an anthology of verses on the monasteries of Mesopotamia and Egypt, and a genealogical work, his fame rests upon his *Book of Songs* (*Kitāb-ul-Aghāni*), which gives an account of the chief Arabian songs, ancient and modern, with the stories of the composers and singers. It contains a mass of information as to the life and customs of the early Arabs, and is the most valuable authority we have for their pre-Islamic and early Muslim days A part of the *Book of Songs* was published by J. G L Kosegarten with Latin translation (Greifswald, 1840). The text was published in 20 vols at Bulaq in 1868 Vol. xxi. was edited by R. E. Brunnow (Leyden, 1888). A volume of elaborate indices was edited by I Guidi (Leyden, 1900), and a missing fragment of the text was published by J. Wellhausen in the *Zeitschrift der deutschen morgenlandischen Gesellschaft,* vol. 50, pp. 146 ff For his life *see* M'G de Slane's translation of Ibn Khallikan's *Biographical Dictionary,* vol. ii. pp. 249 ff. (G. W. T.)

**ABULFARAJ** (13th century): *see* BAR-HEBRAEUS.

**ABUL FAZL** (ăb-ul fahzl) (1551–1602), vizier and historiographer of the Mogul emperor, Akbar, wrote the *Akbar Nameh* or "Book of Akbar" in Persian. It consists of two parts, and is a history of Akbar's reign and the *Ain-i-Akbari,* or "Institutes" of Akbar, giving an account of the constitution, religion and administration of the empire. Akbar was murdered at the instigation of Prince Selim, afterwards Jahangir, who was jealous of the vizier's influence.

A translation of the *Ain-i-Akbari* (Calcutta, 1783–86), by Francis Gladwin, is now exceedingly rare. There is a modern translation (Calcutta, 1873, 1891, 1894): vol. i. by H. Blockmann, vols. ii. and iii. by H. S. Jarrett.

**ABULFEDA** (Abū-l-Fidā' Ismā'īl ibn 'Ali 'Imād-ud-Dnī) (1273–1331), Arabian historian and geographer, was born at Damascus, whither his father Malik ul-Afdal, brother of the prince of Hamah, had fled from the Mongols. He was a descendant of Ayyūb, the father of Saladin. In 1285 he was present at the assault of a stronghold of the knights of St. John, and he took part in the sieges of Tripoli, Acre and Qal'at ar-Rūm. In 1298 he entered the service of the Mameluke Sultan Malik al-Nāsir and in 1310 became governor of Hamah. In 1312 he became prince with the title Malik us-Sālih, and in 1320 received the hereditary rank of sultan with the title Malik ul-Mu'ayyad. For more than twenty years altogether he reigned in tranquillity and splendour, devoting himself to the duties of government and to the composition of the works to which he is chiefly indebted for his fame. He was a munificent patron of men of letters, who came in large numbers to his court. He died in 1331.

BIBLIOGRAPHY.—His chief historical work is *An Abridgment of the History of the Human Race,* annals extending from the creation to the year 1329 (Constantinople, 1869). Various translations of parts of it exist. His *Geography* is founded on the works of his predecessors, and so ultimately on the work of Ptolemy. Parts of the work were published and translated as early as 1650 (*cf.* Carl Brockelmann's *Geschichte der Arabischen Litteratur,* Berlin, 1902, vol. ii. pp. 44–46). The text of the whole was published by M. G. de Slane and M. Reinaud (Paris, 1840), and a French translation with introduction by M. Reinaud and Stanislas Guyard (Paris, 1848–83).

**ABU'L KASIM MANSUR:** *see* FIRDOUSI.

**ABŪ-L-QĀSIM** [Khalaf ibn 'Abbās uz-Zahrāwi], Arabian physician and surgeon, generally known in Europe as ABULCASIS, flourished in the tenth century at Cordova as physician to the caliph 'Abdur-Rahmān III. (912–961).

A part of his compendium of medicine was published in Latin as *Liber theoricae nec non practicae Alsaharavii* (Augsburg, 1519). His manual of surgery was published at Venice in 1497, at Basle in 1541, and at Oxford *Abulcasis de Chirurgia arabice et latine cura Johannis Channing* (2 vols. 1778).

For his other works *see* Carl Brockelmann, *Geschichte der arabischen Literatur* (Weimar, 1898), vol. 1. pp. 239–240; M. Neuberger, *History of Medicine,* vol. I (1910).

**ABŪ 'L WAFĀ** or ALBUZDSCHANI (940–998), Arab astronomer and mathematician, was born at Buzdschan in Khurāsān, and was one of the most learned men of his day. A passage in his *Almagest* is held by some to indicate that he had noted inequalities in the moon's motion, later described as variation. He translated and commented on the works of the Greek mathematicians, and made an exhaustive commentary on Diophantus, but these writings are lost. The existing book in 12 chapters of geometrical constructions in a Persian translation is not his, but appears to be derived from an account of his lectures drawn up by one of his pupils. Abû 'l Wafā introduced the trigonometrical functions and constructed tables of tangents and co-tangents.

*See* Woepcke in *Journal Asiatique,* Feb. and March, 1855.

**ABUNDANTIA,** Roman goddess, the personification of prosperity and good fortune. On the coins of the later Roman emperors she is frequently represented holding a horn of plenty and distributing grain and money She may be compared with Domina Abundia (O. Fr. *Dame Habonde, Notre Dame d'Abondance*), a beneficent fairy, who brought plenty to those whom she visited (Grimm, *Teutonic Mythology,* i. 286–7).

**ABU NUWAS** (Abū 'Alī Hal-asan ibn Hāni'al-Hakamī) (*c.* 756–810), Arabian poet, was born in al-Ahwāz, probably about 756. His mother was a Persian, his father a soldier, a native of Damascus. He is said to have spent a year with the Arabs in the desert to gain purity of language. Settling in Baghdad he enjoyed the favour of Harūn al-Rashīd and al-Amīn, and died there, probably about 810. Abū Nuwās is recognized as the greatest Arab poet of his time Genial, cynical, immoral, he drew on all the varied life of his time for the material of his poems. In his wine-songs especially the manners of the upper classes of Baghdad are revealed. He was one of the first to ridicule the set form of the *qasīda* (elegy) as unnatural, and has satirized this form in several poems

*See* I. Goldziher, *Abhandlungen zur Arabischen Philologie* (Leyden, 1896), i. pp. 145 ff. His poems were collected by several Arabian editors. One such collection (the MS. of which is now in Vienna) contains nearly 5,000 verses. His collected poems (*Diwān*) have been published in Cairo (1860), in Beirūt (1884) and an edition by Isma 'īl al-Nabhānī (Cairo, 1904). The wine-songs were edited by W. Ahlwardt under the title *Diwān des Abu Nowas.* 1. *Die Weinlieder* (Greifswald, 1861).

**ABU SIMBEL** or **IPSAMBUL,** the name of a group of temples of Rameses II. (*c.* 1250 B C.) in Nubia, on the left bank of the Nile, 56m. by river south of Korosko. They are hewn in the sandstone cliffs at the riverside, and are three in number. The principal temple, begun by Seti and completed by his son, is probably the greatest and most imposing of all rock-hewn monuments. It was discovered by Burckhardt in 1812 and opened by Belzoni in 1817; the front has been cleared several times, but the sand is always pressing forward from the north end. The hillside was recessed to form the façade, backed against which four immense seated colossi of the king, in pairs on either side of the entrance, rise from a platform or forecourt reached from the river by a flight of steps The colossi are 65ft. in height, of nobly placid design, and are accompanied by smaller figures of Rameses' queen and their sons and daughters; behind and over them is the cornice, with the dedication below a long row of apes, standing in adoration of the rising sun. The temple is dedicated primarily to the solar gods Amenra of Thebes and Raharakht of Heliopolis, the true sun god; it is oriented to the east so that the rays of the sun in the early morning penetrate the whole length of two great halls to the innermost sanctuary and fall upon the central figures of Amenra and Rameses, which are there enthroned with Ptah of Memphis and Raharakht on either side. The interior of the temple consists of a series of halls, penetrating for 185ft. into the solid rock and decorated with coloured sculpture of fine workmanship and in good preservation; some of the scenes are of religious import (amongst them Rameses as king making offerings to himself as god), others illustrate war in Syria, Libya and Ethiopia: another series depicts the events of the famous battle with the Hittites and their allies at Kadesh, in which Rameses saved the Egyptian camp and army by his personal valour Not the least important feature of the temple belongs to a later age when some Greek, Carian and Phoenician soldiers of one of the kings named Psammetichus (apparently Psammetichus II., 594–589 B C) inscribed their names upon the two southern colossi, doubtless the only ones then clear of sand. These graffiti are of the highest value for the early history of the alphabet, and as proving the presence of Greek mercenaries in the Egyptian armies of the period. The upper part of the second colossus (from the south) has fallen; the third was repaired by Sethos II. not many years after the completion of the temple. A small temple, immediately to the south of the first, is believed to have had a built antechamber: it is the earliest known example of a "birth chapel," such as was usually attached to Ptolemaic temples for the accommodation of the divine mother-consort and her son The third and northernmost temple, separated from the others by a ravine, is on a large scale; the colossi of the façade are six in number and 33ft. high, representing Rameses and his queen Nefrēre, who dedicated the temple to the goddess Hathōr.

THE COLOSSAL STATUES OF RAMESES II AT ABU SIMBEL ARE 65FT. HIGH AND ARE ACCOMPANIED BY SMALLER STATUES OF THE MEMBERS OF HIS FAMILY

**ABŪ TAMMĀM** (Habīb ibn Aus) (807–846), Arabian poet, was born in Jāsim (Josem), a place to the north-east of the Sea of Tiberias or near Manbij (Hierapolis). He died in Mosul Abū Tammām is best known as the compiler of the collection of early poems known as the *Hamāsa* (*q v*). Two other collections of a similar nature are ascribed to him. His own poems have been somewhat neglected owing to the success of his compilations. His poems (*Diwān*) were published in Cairo (A D. 1875).

*See* Life in Ibn Khallikan's *Biographical Dictionary,* trans. by M'G. de Slane (Paris and London, 1842), vol. i. pp. 348 ff.; and in the *Kitāb ul-Aghāni* (Book of Songs) of Abulfaraj (Bulaq, 1869), vol. xv pp. 100–108, also D. S. Margoliouth "Indices to the Diwan of Abu Tammam" in the *Journal* of the Royal Asiatic Society (1905).

**ABUTILON** (from the Arabic *aubūtīlūn,* a name given by Avicenna to this or an allied genus), a genus of tropical shrubs of the family Malvaceae (mallows), having about 100 widely distributed species, often called flowering maple and Chinese bell-flower. They are free-growing, with showy bell-shaped flowers, and are favourite greenhouse plants.

They are grown as summer bedding plants but will stand no frost and are readily propagated from spring- or autumn-rooted cuttings.

Many hybrids have variegated foliage.

**ABUTMENT,** a construction in masonry designed to receive and resist the lateral pressure of an arch, vault or strut. When part of a wall it is termed a buttress (*q v.*).

**ABU UBAIDA** (Ma'mar ibn ul-Muthannal) (728–825), Arabian scholar, was born a slave of Jewish-Persian parents in Basra. In 803 he was called to Baghdad by Harūn al-Rashid. He died in Basra. He was one of the most learned and authoritative scholars of his time in the Arabic language, antiquities and stories. The titles of 105 of his works are mentioned in the *Fihrist,* and his *Book of Days* is the basis of parts of the history of ibn al-Athīr and of the *Book of Songs,* but nothing of his (except a song) seems to exist now in an independent form.

BIBLIOGRAPHY —See *Life* in ibn Khallikān's *Biographical Dictionary*, trans by M'G de Slane (1842), vol. III., pp 388–398, also I. Goldziher's *Muhammedanische Studien* (Halle, 1888), vol I., pp 194–206

**ABYDOS,** ancient town of Mysia, Asia Minor, on the Hellespont, here scarcely a mile broad Probably originally a Thracian town, it was afterwards colonized by Milesians Here Xerxes crossed the strait on his bridge of boats when he invaded Greece. Abydos is celebrated for its vigorous resistance to Philip V of Macedon (200 B C ), and is famed in story for the loves of Hero and Leander Until late Byzantine times the toll station of the Hellespont, its importance was transferred to the Dardanelles (*q v* ), after the building of the "Old Castles" by Sultan Mohammed II (*c* 1456)

**ABYDOS,** one of the most ancient cities of Upper Egypt, about 7m west of the Nile in lat 26° 10′ N (railway station Al-Baliana) The Egyptian name was *Abdu,* "the hill of the symbol or reliquary" in which the sacred head of Osiris was preserved Thence the Greeks named it Abydos, like the city on the Hellespont; the modern Arabic name is *Arabet el Madfuneh.* The history of the city begins in the late prehistoric age, it having been founded by the pre-Menite kings whose town, temple and tombs have been found there The kings of the 1st dynasty, and some of the 2nd dynasty, were also buried here, and the temple was renewed and enlarged by them Great forts were built on the desert behind the town by three kings of the 2nd dynasty. The temple and town continued to be rebuilt at intervals down to the times of the 30th dynasty, and the cemetery was used continuously In the 12th dynasty a gigantic tomb was cut in the rock by Senwosri (or Senusert) III Seti I. in the 19th dynasty founded a great new temple to the south of the town in honour of the ancestral kings of the early dynasties; this was finished by Rameses II , who also built a lesser temple of his own. Mineptah added a great Hypogeum of Osiris to the temple of Seti. The latest building was a new temple of Nekhtnebf in the 30th dynasty

The worship here was of the jackal god Upuaut (Ophois, Wepwoi), who "opened the way" to the realm of the dead, increasing from the 1st dynasty to the time of the 12th dynasty and then disappearing after the 18th Anher appears in the 11th dynasty; and Khentamenti, the god of the western Hades, rises to importance in the middle kingdom and then vanishes in the 18th The worship here of Osiris in his various forms begins in the 12th dynasty and becomes more important in later times, so that at last the whole place was considered as sacred to him.

The temples successively built here on one site were nine or ten in number, from the 1st dynasty, to the 26th dynasty (500 B.C ). The first was an enclosure, about 30 x 50ft., surrounded by a thin wall of unbaked bricks. Covering one wall of this came the second temple of about 40ft. square in a wall about 10ft. thick. An outer *temenos* (enclosure) wall surrounded the ground. This outer wall was thickened about the 2nd or 3rd dynasty. The old temple entirely vanished in the 4th dynasty, and a smaller building was erected behind it, enclosing a wide hearth of black ashes. Pottery models of offerings are found in the ashes, and these were probably the substitutes for sacrifices decreed by Cheops (Khufu) in his temple reforms. A great clearance of temple offerings was made now, or earlier, and a chamber full of them has yielded the fine ivory carvings and the glazed figures and tiles which show the splendid work of the 1st dynasty. A vase of Menes with purple inlaid hieroglyphs in green glaze and the tiles with relief figures are the most important pieces. The noble statuette of Cheops in ivory, found in the stone chamber of the temple, gives the only portrait of this ruler. The temple was rebuilt entirely on a larger scale by Pepi I. in the 6th dynasty. He placed a great stone gateway to the temenos, an outer temenos wall and gateway, with a colonnade between the gates. His temple was about 40 x 50ft inside, with stone gateways front and back, showing that it was of the processional type. In the 11th dynasty Menthotp (Mentuhotep) III. added a colonnade and altars. Soon after, Sankhkerē entirely rebuilt the temple, laying a stone pavement over the area, about 45ft. square, besides subsidiary chambers. Soon after Senwosri (Senusert) I. in the 12th dynasty laid massive foundations of stone over the pavement of his predecessor. A great temenos was laid out enclosing a much larger area, and the temple itself was about three times the earlier size.

The 18th dynasty began with a large chapel of Amasis I , and then Thothmes III built a far larger temple, about 130 x 200ft. He made also a processional way past the side of the temple to the cemetery beyond, with a great gateway of granite Rameses III added a large building, and Amasis II in the 26th dynasty rebuilt the temple again, and placed in it a large monolith shrine of red granite, finely wrought The foundations of the successive temples were comprised within about 18ft depth of ruins

The temple of Seti I was built on entirely new ground half a mile to the south of the long series of temples just described This is the building best known as the Great Temple of Abydos, being nearly complete and an impressive sight. The long list of the kings of the principal dynasties carved on a wall is known as the "Table of Abydos " There were also seven chapels for the worship of the king and principal gods. The temple was originally 550ft long, but the forecourts are scarcely recognizable, and the part in good state is about 250ft long and 350ft wide, including the wing at the side Excepting the list of kings and a panegyric on Rameses II , the subjects are not historical but mythological The adjacent temple of Rameses II. was much smaller and simpler in plan; but it had a fine historical series of scenes around the outside, of which the lower parts remain A list of kings, similar to that of Seti, formerly stood here; but the fragments were sold by the French consul to the British Museum

The royal tombs of the earliest dynasties were placed about a mile back on the great desert plain The earliest is about 10 x 20ft inside, a pit lined with brick walls, and originally roofed with timber and matting Others also before Menes are 15 x 25ft The tomb probably of Menes is of the latter size After this the tombs increase in size and complexity. The tomb-pit is surrounded by chambers to hold the offerings, the actual sepulchre being a great wooden chamber in the midst of the brick-lined pit. Rows of small tomb-pits for the servants of the king surround the royal chamber, many dozens of such burials being usual By the end of the 2nd dynasty the type changed to a long passage bordered with chambers on either hand, the royal burial being in the middle of the length. The greatest of these tombs with its dependencies covered a space of over 3,000sq. yards. The contents of the tombs have been nearly destroyed by successive plunderers, enough remained to show that rich jewellery was placed on the mummies, a profusion of vases of hard and valuable stones from the royal table service stood about the body, the store-rooms were filled with great jars of wine, perfumed ointment and other supplies, and tablets of ivory and ebony were engraved with a record of the yearly annals of the reigns.

The cemetery of private persons begins in the 1st dynasty with some pit tombs in the town. It was extensive in the 12th and 13th dynasties and contained many rich tombs. In the 18th–20th dynasties a large number of fine tombs were made, and later ages continued to bury here till Roman times.

The forts lay behind the town That known as Shunet ez Zebib is about 450 x 250ft over all, and still stands 30ft. high. It was built by Khasekhemui, the last king of the 2nd dynasty. Another fort nearly as large adjoined it, and is probably rather older. A third fort of a squarer form is now [illegible] the Coptic convent; its age cannot be ascertained.

Jean Capart, *Abydos: Le Temple de Seti I.* (Bruxelles, 1912) ; *The Cemeteries of Abydos,* 3 vols. (Egypt Exploration Fund, 1913–14).

**ABYSS,** any deep place (Gr. *ἀ-*, privative, *βυσσός*, bottom), a bottomless depth. From the late popular *abyssimus* (superlative of Low Latin *abyssus*) through the French *abisme* (i.e., *abîme*) is derived the poetic form *abysm,* pronounced as late as 1616 to rhyme with *time.* The adjective "abyssal" or "abysmal" has been used by zoologists to describe deep regions of the sea. In heraldry the abyss is the middle of an escutcheon. In the Greek version of the Old Testament the word represents (1) the original chaos (Gen. i. 2), (2) the Hebrew *tehom,* which is used also in apocalyptic literature and in the New Testament for hell. In the Septuagint cosmography the word is applied (*a*) to the waters under the earth, and (*b*) to the waters of the firmament

which were regarded as closely connected with those below. Derivatively it acquired the meaning of the place of the dead. In *Revelation* it is the prison of evil spirits whence they may occasionally be let loose, and where Satan is doomed to spend 1,000 years. In rabbinical cosmography the abyss is a region of Gehenna situated below the ocean bed and divided into three or seven parts imposed one above the other. In the Kabbalah the abyss as the opening into the lower world is the abode of evil spirits, and corresponds to the opening of the abyss to the world above. In general, the abyss is regarded vaguely as a place of indefinite extent, the abode of mystery and sorrow.

**ABYSSINIA** (officially Ethiopia), an inland country and empire of North-east Africa lying, chiefly, between 5° and 15° N. and 35° and 42° E. It is bounded on the north by Eritrea (Italian), on the west by the Anglo-Egyptian Sudan, on the south-west and south by Uganda and Kenya, on the south-east and east by British, Italian and French Somaliland. The coast lands in European hands, which cut off Abyssinia from access to the sea, vary in width from 40 to 250 miles and are narrowest on the north-east border near the Red Sea. Abyssinia in the north is 230m. east to west, but is 900m. wide along latitude 9° N., and resembles a triangle with apex north. It is divided into Abyssinia proper (*i.e.*, the old Ethiopian empire consisting of Tigré, Amhara, Gojam and part of Shoa) with the south-west Galla highlands and the remainder of Shoa all forming a geographical unit—and cut off from it by the great Rift valley—and the Somaliland plateau with Harar: nearly all this country being surrounded by tracts of low-lying desert. The area of the whole State is 305,731 sq.mi., of which Abyssinian Somaliland covers about a third. Pop. (1939) estimated at about 9,450,000.

## PHYSICAL FEATURES

Between the Upper Nile and the low south-west shores of the Red Sea and the Gulf of Aden lie elevated plateaux with mountain ranges. The plateaux rise abruptly from the plains, constituting outer mountain chains. The Abyssinian highlands are thus a clearly marked orographic division From Ras Kasar (18°N.) to Annesley Bay (15°N.) the eastern wall of the plateau runs parallel to the Red Sea. It then turns due south and follows closely the line of 40°E. for some 400m. About 9°N. the River Hawash flows east through the opening of the Rift valley. The main range at this point trends south-west, while south of the Hawash valley, which is some 3,000ft. below the level of the mountains, another massif rises in a direct line south. The second range sends a chain (the Harar Hills) east to the Gulf of Aden. The two chief eastern ranges run parallel south by west on either side of the Rift valley—in which are a series of lakes—to about 3°N., the outer (eastern) spurs of the plateau still keeping along the line of 40°E. The southern escarpment of the plateau is highly irregular, but has a general direction north-west and south-east from 6°N. to 3°N. The western wall of the plateau, from 6°N. to 11°N., is precipitous. North of 11°N. the hills turn more to the east, and fall more gradually to the plains at their base. On its northern face also the plateau falls in terraces to the level of the eastern Sudan. The eastern escarpment has a mean height of 7,000 to 8,000ft., and is often precipitous. Torrents descend narrow deep clefts to lose themselves in the sandy coast land; they afford means of reaching the plateau, as alternatives to the easier route through the Hawash valley. On surmounting this rocky barrier the traveller finds that the encircling rampart rises little above the normal level of the plateau. The northern highlands, mainly 10° to 15°N., consist of Archaean rocks of mean height 7,000 to 7,500ft., and a deep central depression contains Lake Tana. Above the plateau mountain ranges rise to 12,000 and over 15,000ft., with fantastic forms, and cut by enormous fissures due to erosion; some are wider, others have the opposite walls but 200 or 300yd. apart, and fall almost vertically thousands of feet. Numerous isolated flat-topped hills or small plateaus known as *ambas*, are left. The highest peaks are in the Simen (or Semien) ranges, north-east of Lake Tana, which culminate in a snow-covered peak, Dajan (15,160ft.). Parallel with the eastern escarpment the heights rise to Mt. Kollo (14,100ft.) south-west of Magdala. The valley between these hills and the eastern escarpment is one of the largest and most profound chasms in Abyssinia. Between Lake Tana and the eastern hills are Mounts Guna (13,800ft.) and Uara Sahia (13,000ft.) The highlands south of latitude 10°N. have more open tableland than the northern portion and fewer lofty peaks, but the general character is still that of a much broken hilly plateau

The uplands usually slope north-west and nearly all the large rivers flow to the Nile; the Takkaze in the north, the Abbai in the centre, and the Sobat in the south make up four-fifths of the entire drainage. The rest is carried off almost due north by the Khor Baraka, which occasionally reaches the Red Sea south of Suakin, by the Hawash, which runs out in the salt lake area near the head of Tajura Bay; by the Webi Shibeli and Juba, which flow south-east through Somaliland, though the Shibeli fails to reach the Indian ocean; and by the Omo, the main feeder of the closed basin of Lake Rudolf The Takkaze, the true upper course of the Atbara, falls from about 7,000ft. in the central tableland to 2,500ft in the tremendous crevasse through which it sweeps west, north, and west again, to the western terraces and the Sudan. During the rains the Takkaze (*i.e.*, the "Terrible") rises some 18ft. above its normal level, and at this time forms an impassable barrier between the northern and central provinces Lower down, the river has the Arab name Setit The Setit is joined (14° 10′N., 36°E.) by the Atbara, formed by several streams of the mountains west and north-west of Lake Tana. The Gash or Mareb is the most northerly Abyssinian river flowing towards the Nile. It rises on the landward side of the eastern escarpment within 50 miles of Annesley Bay on the Red Sea, and reaches the Sudan near Kassala to lose itself in the sandy plain. The Mareb is dry for a great part of the year, but like the Takkaze has sudden freshets during rains. Only the left bank of the upper course of the river is in Abyssinian territory, the Mareb here forming the boundary between Eritrea and Abyssinia

The Abbai or Blue Nile has its source near Mt. Denguiza in the Gojam highlands (about 11°N. and 37°E.) and first flows for 70m. nearly due north to the south side of Lake Tana (*q.v.*), through which it runs for some 20 miles and, escaping by a deep crevasse, bends in a great semicircle, east, south and north-west, the reverse of that of the Takkaze, down to the plains of Sennar. The Abbai has many perennial tributaries, of which the principal are the Bashilo, the Jamma, the Muger, the Gudiv, the Didessa, largest of all, and the Yabus. The right-hand tributaries, rising mostly on the western sides of the plateau, have steep slopes and are generally torrential; the Bolassa is perennial, and the Rahad and the Dinder are important in flood-time.

In the mountains and plateaux of Kaffa and Galla in south-west Abyssinia rise the chief affluents of the Sobat tributary of the Nile. The Akobo joins the Pibor, which unites with the Baro to form the Sobat. These rivers (which form for 250m the west or south-west frontiers of Abyssinia) descend in great falls, and like other Abyssinian streams are unnavigable in their upper courses. The Baro on reaching the plain affords, however, an open waterway to the Nile (*see* NILE; SOBAT and SUDAN).

The chief eastward river is the Hawash, rising in the Shoan uplands and bending first south-east and then north-east. It reaches the Afar (Danakil) lowlands through a broad breach in the eastern escarpment of the plateau, where it is nearly 200ft wide and 4ft. deep, even in the dry season, and during the floods rises 50 or 60ft. above low-water mark, thus inundating the plains for many miles along both its banks. Yet it fails to reach the coast and after a winding course of about 500m. is lost near Lake Aussa, some 60 or 70m. from the head of Tajura Bay. From Shoa south-west to Lake Rudolf extends a chain of lovely upland lakes, some fresh, some brackish, some completely closed, others connected by short channels, the chief links in their order from north to south being:— Zwai, communicating southwards with Hora Abyata, which connects with Langana, all in the Arusi Galla territory; then Shala and Awusa; farther south Abaya (Margherita) with an outlet to a smaller tarn, Chamo, in the romantic Baroda and Gamo districts, skirted on the west by grassy slopes and wooded ranges (6,000 to nearly 9,000ft.);

DRAWN BY JOHN BARTHOLOMEW & SONS LTD., EDINBURGH

ABYSSINIA COVERS 305,731 SQ.MI., OF WHICH ABYSSINIAN SOMALILAND MAKES NEARLY A THIRD. MOST OF THE COUNTRY WEST OF 40° IS A PLATEAU FROM WHICH RISE VARIOUS MOUNTAIN RANGES. ON EVERY SIDE EXCEPT THE SOUTH THE WALLS OF THE PLATEAU RISE ABRUPTLY FROM THE PLAINS. IN A DAY'S JOURNEY THE TRAVELLER MAY PASS FROM TROPICAL TO ALMOST ALPINE CONDITIONS OF CLIMATE. EQUALLY GREAT IS THE RANGE OF THE FLORA AND FAUNA. THERE ARE FEW LARGE TOWNS

lastly, in the Asille country, Lake Stefanie, the Chuwaha of the natives, completely closed and about 1,800ft. above sea. To the same system obviously belongs the neighbouring Lake Rudolf (*q.v.*), larger than all the rest together. This lake receives at its northern end (1,800ft. above sea level) the waters of the Omo, a rapid and unnavigable perennial stream with many affluents, rising in the Shoa highlands and falling 6,000ft. in its course of 370m. The chief rivers of Somaliland (*q.v.*), Webi Shibeli and Juba (*q.v.*), rise on the south-eastern slopes of the Abyssinian escarpment and most of their course is through Abyssinian territory.

## GEOLOGY

The East African tableland is continued into Abyssinia, the following formations being represented:—

**Archaean.**—Metamorphic rocks, the main mass of the tableland, are exposed in every deep valley in Tigré and along the Blue Nile. Mica schists are most prevalent. Hornblende schists also occur and a compact felspathic rock in the Suris defile. The foliae of the schists strike north and south.

**Triassic (?).**—In the region of Adigrat the metamorphic rocks are invariably overlain by white and brown sandstones, unfossiliferous, and attaining a maximum thickness of 1,000ft. They are overlain by the fossiliferous limestones of the Antalo group. Around Chilga and Adigrat coal-bearing beds occur, which Blanford suggests may be of the same age as the coal-bearing strata of India. The Adigrat sandstone possibly represents some portion of the Karroo formation of South Africa.

**Jurassic.**—The fossiliferous limestones of Antalo are generally horizontal, but much disturbed when interstratified with trap rocks. The fossils are all characteristic Oolite forms and include a species of *Hemicidaris, Pholadomya, Ceromya, Trigonia* and *Alaria.*

**Igneous Rocks.**—Above a height of 8,000ft. the country consists of bedded traps belonging to two distinct and unconformable groups. The lower (Ashangi group) consists of basalts and dolerites often amygdaloidal. Their relation to the Antalo limestones is uncertain, but Blanford considers them to be not later in age than the Oolite. The upper (Magdala group) contains

much thick trachytic rock lying perfectly horizontally, and giving rise to a series of terraced ridges characteristic of central Abyssinia. They are interbedded with unfossiliferous sandstones and shales. Of more recent date (probably Tertiary) are some igneous rocks, rich in alkalis, in parts of southern Abyssinia. Still more recent are the basalts and ashes west of Massawa and around Annesley Bay, and known as the Aden volcanic series. The older igneous rocks have suffered severe denudation, giving deep and narrow ravines, sometimes to a depth of 3,000 to 4,000ft.

**Climate.**—Somaliland and the Danakil lowlands are hot and dry with semi-desert conditions; the lower basin of the Sobat is hot, swampy and malarious. But over most of Abyssinia, as well as the Galla highlands, the climate is very healthy and temperate. The country lies wholly within the tropics, but its nearness to the equator is counterbalanced by the elevation of the land. In the deep valley of the Takazze and Abbai, and generally below 4,000ft., conditions are torrid and fevers prevalent. On the uplands, however, the air is bracing and the nights very bleak. The mean range of temperature is between 60° and 80°. On the higher mountains the climate is Alpine. The atmosphere on the plateaus is exceedingly clear. In addition to variation in climate with elevation, the year may be divided into two main seasons, the dry (*baga*) from Oct. to mid-June, and the rainy (*karamt*), caused by the south-west monsoon, from mid-June to the end of September. There is also a period of so-called "little rains," generally about March.

The incidence of the rains varies slightly in different parts of the country, the rain moving from north to south; the average annual rainfall at Addis Ababa over a period of 25 years amounted to 1,200mm.; it is on the whole rather lighter in the north. The rainy season is of great importance not only to Abyssinia but to the countries of the Nile valley, as the prosperity of the eastern Sudan and Egypt is largely dependent upon the Abyssinian rainfall.

**Flora and Fauna.**—As in a day's journey the traveller may pass from torrid to almost Alpine conditions of climate, so great also is the range of flora and fauna. In the valleys and lowlands vegetation is dense, but the plateaus are comparatively bare, with thinly scattered trees and bushes. The glens and ravines are often thickly wooded, and offer a delightful contrast to the open downs. These conditions are particularly characteristic in the north; in the south the upland vegetation is more luxuriant. The date palm, mimosa, wild olive, giant sycamores, junipers and laurels, the myrrh and other gum trees (gnarled and stunted, these flourish most on the eastern foothills), a magnificent pine (the Natal yellow pine, which resists the attacks of the white ant), the fig, orange, lime, pomegranate, peach, apricot, banana and other fruit trees; the grape vine (rare), blackberry and raspberry; the cotton and indigo plants, and occasionally the sugar cane, are all found. There are in the south large forests of valuable timber; and the coffee plant is indigenous in the Kaffa country, whence it takes its name. Many grasses and flowers abound. Large areas in the highlands are covered by the Kosso tree, which grows from 30 to 40ft. high and has abundant pendant red blossoms; the flowers and the leaves are prized for medicinal purposes. The fruit of the kurarina, found almost exclusively in Shoa, yields a black grain highly esteemed as a spice. On the tableland a great variety of grains and vegetables are cultivated. A fibrous plant, the sansevieria, grows wild in the semi-desert regions of the north and south-east.

Elephant and rhinoceros are found in low-lying districts, especially in the Sobat valley. The hippopotamus and crocodile inhabit many of the rivers and lakes, in some of which otters of large size are plentiful. Lions abound in the low countries and in Somaliland. Leopards, spotted and black, are numerous and often large; hyaenas are found everywhere and are hardy and fierce; lynx, wolf, wild dog and jackal are also common. Boars and badgers are more rarely seen. The giraffe is found in the west; the zebra and wild ass frequent the lower plateaux and the rocky hills of the north. Antelopes and gazelles of many varieties are numerous in most parts and include greater and lesser kudu (both rather rare), oryx, duiker, gemsbuck, hartebeest, gerenuk (the most common—it has long thin legs and a camel-like neck), klip-springer, found on the high plateaus as well as in the lower districts, and the dik-dik, the smallest of the antelopes, rarely over 10 lb., common in the low countries and the foothills. The rarest of all these is the nyala. The civet is found in many parts but chiefly in the Galla regions. Squirrels and hares, monkeys, notably the guereza, gelada, guenon and dog-faced baboon, range abundantly from the warm lowlands to heights of 10,000ft. Eagles, vultures, hawks, bustards and other birds of prey, partridges, duck, teal, guinea-fowl, sand-grouse, curlews, woodcock, snipe, pigeons, thrushes and swallows are very plentiful. A fine variety of ostrich is common. Among birds prized for plumage are the marabout, crane, heron, blackbird, parrot, jay, and many sun-birds of extraordinary brilliance. Serpents are not numerous but several are poisonous. The bee's honey is an important part of the people's food. The locust is a pest. There are thousands of varieties of butterflies and other insects.

## ADMINISTRATION AND INDUSTRY

**Provinces and Towns.**—The ancient provincial divisions of Abyssinia (Amhara, Tigré, Gojam, Shoa, etc.) are for the most part now mere geographical expressions, having been broken up into smaller governorships with the exception of the ancient kingdom of Gojjam, enclosed by the great bend of the Abbai, which is still a single governorship. The more important provinces number about 20, of which may be mentioned: Gojam, North and South Tigré, Bagemdir, Harar, Salale, Waag and Lasta and Jimma. Each is divided into sub-districts and further subdivided into groups of villages. With the exception of the capital, Addis Ababa (*q.v.*), Harar, and Diredawa, there are no towns of any size in Abyssinia. Centuries of almost continual warfare between the provinces help to account for the absence of large towns; also royal residences have changed frequently on exhaustion of fuel supplies. The earliest capital appears to have been Aksum (*q.v.*), in Tigré, where there are extensive ruins. Gondar in Amhara was the capital from the middle ages to the middle of the 19th century. Addis Ababa in Shoa, the capital since 1892, has about 150,000 inhabitants, Diredawa 30,000 and Harar 25,000

None of the other towns has a permanent population exceeding 6,000 to 10,000, but several have large periodic markets. In Tigré are Aduwa (17m. E. by N. of Aksum), Aksum, Adigrat, Makale and Antalo. The three last are near the eastern escarpment of the high plateau on the direct road South from Massawa to Shoa. West of Adigrat is the monastery of Debra-Damo, a most celebrated sanctuary.

In Amhara are Magdala (*q.v.*), formerly the residence of King Theodore, and the place of imprisonment of the British captives in 1866; Debra-Tabor ("Mount Tabor"), the chief royal residence under King John in a strong strategic position, overlooks the fertile plain east of Lake Tana about 8,620ft. above sea. Amba-Mariam, a fortified station midway between Gondar and Debra-Tabor near the north-east side of Lake Tana, with a population of 3,000, has the famous shrine and church dedicated to St. Mary, whence the name Mahdera-Mariam ("Mary's Rest"). It was a royal residence, and is an important market and place of pilgrimage, a few miles south-west of Debra-Tabor; Sokota, a great central market, capital of Waag, is at the convergence of several main routes. In Shoa are: Ankober, formerly the capital of the kingdom, Debra-Birhan ("Mountain of Light"), once a royal residence; Liché (Litché), one of the largest market towns in the south. Lfeka, the largest market in Gallaland, communicates direct with Gojam, Shoa and other parts of the empire. Anderacha, the commercial centre of Kaffa, and Jiren, capital of the neighbouring province of Jimma, attract traders from surrounding provinces.

**Communications.**—There is a single line of railway from Jibuti to Addis Ababa (486m.) but, outside the capital, there are no roads for wheeled traffic. Transport is by mules, donkeys, pack-horses and (in the lower regions) camels. Telegraph lines connect Addis Ababa and several important towns of the North with Massawa, Harar and Jibuti. There is also a telephonic

service, but outside Addis Ababa, the capital, it is subject to frequent interruption.

**Agriculture.**—The soil is exceedingly fertile and agriculture is extensively followed; in the lower regions maize, durra, wheat, barley, rye, *teff*, pease, cotton and sugar-cane are grown. *Teff*, a kind of millet with pinhead grains, is the common bread grain. The low grounds also produce a grain, *tocussa*, from which black bread is made. Certain oleaginous plants, the *suf*, *nuc* and *selite* (no European equivalents for the native names), and the groundnut, are largely grown. The castor bean grows wild, the green castor in the low, damp regions, the red castor at medium altitudes. The kat plant, a medicinal tonic, is largely grown in Harar province. On the higher plateaus the chief crops are wheat, barley, teff, peppers, vegetables of all kinds and coffee. Above 10,000ft. one finds barley, oats, beans and occasionally wheat. Of all cereals teff and barley are the most widely and generally grown. In the high plateaus sowing begins in May, in the lower plateaus and the plains in June, but where the summer is long and rain abundant sowing and reaping are going on at the same time. Most regions yield two, many three, crops a year.

**Stock.**—The land is admirably adapted for stock raising; enormous herds of cattle estimated at from 10 to 15 million head are found in Abyssinia, of which the most remarkable are the immensely long horned Sanga or Galla oxen. Most cattle are of the zebu or hump-backed variety, but there are also two breeds—one large, the other resembling the Jersey cattle—which are straight-backed. Sheep, of which there are also immense flocks, belong to the short and fat-tailed variety. The majority are not wool-bearing, but in one district a very small black sheep is raised for wool. The small mountain breed of sheep weigh no more than 20 to 30lb. apiece. Goats are of both the long and short-haired varieties, those from the Arusi Galla country having fine silky hair sometimes 16in. long. Large quantities of butter, generally rancid, are made from the milk of cows, goats and sheep. In the Leka province small black pigs are bred in considerable numbers. The horses (very numerous) are strong and only about 14 hands high. The best breeds come from the Shoa uplands. The ass is also small and strong; and the mule, bred in large numbers, is of excellent quality, and, both as a transport animal and as a mount, is preferred to the horse. The mule, which averages 12 hands, thrives in every condition of climate, is fever-proof, travels over the most difficult mountain passes with absolute security and carries a load of from 150 to 200lb.

**Minerals.**—In the south and west provinces placer gold mines along the water-courses are worked by Gallas as an industry subsidiary to tending their flocks and fields. In the Wallega district veins of gold-bearing quartz and finds of platinum have been reported. Iron, coal, potash and other minerals are found. Rock-salt is obtained from the province of Tigré.

**Trade and Currency.**—The small progress in the economic and commercial development may be attributed to disturbed political conditions (until quite recently), the lack of communications, bad methods of taxation, suspicion of foreign enterprise and currency difficulties. Some European commercial enterprises have been started and there are indications that the Government will be able to give more sympathetic attention in the future to this. A Belgian company has acquired the alcohol monopoly, but is meeting with great difficulties; a Franco-Belgian company has been formed for cotton cultivation, two Belgian companies are developing large coffee plantations in addition to a few smaller undertakings. Banking is a monopoly of the Bank of Abyssinia (a branch of the National Bank of Egypt) under charter of Emperor Menelek.

The total trade approximates £2,500,000 annually. The chief exports are coffee and hides, and the principal imports, salt, cotton fabrics and hardware. The main channel of trade is the Franco-Ethiopian railway, from Addis Ababa to the port of Jibuti in French Somaliland. The principal trade routes with the Sudan are via Gambela, Gallabat and Roseires. Other trade routes are through the Italian colony of Eritrea to Massawa, and through Harar to Berbera in British Somaliland. The currency is the Maria Theresa and Menelek dollars of a nominal value of about 2s., but in parts of the country bars of salt or even cartridges are used.

**Government.**—The political institutions are of a feudal character, and within their provinces the *rases* and other chiefs exercise large powers. The empress and regent have a number of ministers and a council of elders of the Crown. The legal system (*Feta Negast*) is a strange combination of various origins based on the Mosaic Code; the chief judicial officer is the *Aja Negus* (breath of the king). From all decisions there is an appeal to the throne. The powerful Abyssinian Church (*q.v.*) is presided over by the *Abuna*, always a Copt nominated from Egypt. The priests, an ignorant body, teach the scriptures in Giz, a tongue understood by very few. Apart from this and two schools in Addis Ababa, for which a few European teachers have been introduced, education is practically non-existent. The Abyssinian calendar divides the year into 12 months of 30 days each, followed by one month of five days (six in leap year). The year begins on 1st Maskaram, our Sept. 11 (12 in the European year preceding our leap year) and is then seven years behind the European year; from Jan. 1 to Sept. 10 it is eight years behind. The land is not held in fee simple but is subject to the control of the throne or the church. Revenue is derived from a 10% customs duty on imports, and from a levy on all forms of productions; but as the provincial governors receive no salaries the receipts of the central Government are subject consequently to fluctuations. (C. F. R.)

**Defence.**—The early history of Abyssinia was marked by the struggles of an early Christian community against pagan and Mohammedan invaders. Early Portuguese records (1520–27) contain some entries of military interest. King Theodore (b. 1818) first conceived the idea of organizing an Abyssinian army on European lines. His power was broken in 1868 by an expedition under Lord Napier of Magdala, sent to the succour of Europeans whom he had made prisoner. (*See* also EGYPT: *Egypt and Sudan Campaigns, 1882–1900*).

In March 1896 Theodore's successor Menelek successfully defended the country against an Italian invading force, 200,000 men responding to his call to arms.

In time of war every able-bodied Abyssinian is expected to serve.

According to estimates, about 250,000–300,000 Abyssinians (including a small standing army) could be equipped with modern rifles; but lack of commissariat would prevent a large force from keeping the field long.

From 1890 onwards various expedients had been adopted ineffectively by the European Powers to limit the import of arms.

Under the terms of a treaty concluded in May 1902 an area near Itang (Baro river) bordering the Sudan cannot be used for any military purpose (State Papers, vol. 95, p. 467). (G. G. A.)

## HISTORY

**Early Records.**—Abyssinia, or at least the northern portion of it, was included in the tract of country known to the ancients as Ethiopia, the northern limits of which reached at one time to about Syene. The connection between Egypt and Ethiopia was in early times very intimate, and occasionally the two countries were under the same ruler, so that the arts and civilization of the one naturally found their way into the other. In early times, too, the Hebrews had commercial intercourse with the Ethiopians; and according to Abyssinian tradition the queen of

Sheba who visited Solomon was a monarch of their country, and from their son Menelek the kings of Abyssinia claim descent. During the Captivity many of the Jews settled here and brought with them a knowledge of the Jewish religion. Under the Ptolemies, the arts as well as the enterprise of the Greeks entered Ethiopia, and led to the establishment of Greek colonies. Out of these Greek colonies appears to have arisen the kingdom of Auxume which flourished from the 1st to the 7th century A.D. and was at one time nearly coextensive with Abyssinia proper. The capital Auxume and the seaport Adulis were then the chief centres of the trade with the interior of Africa in gold dust, ivory, leather, aromatics, etc. At Axum, the site of the ancient capital, many vestiges of its former greatness still exist; and the ruins of Adulis, which was once a seaport on the bay of Annesley, are now about 4 miles from the shore (*see* the article, ETHIOPIA).

**Introduction of Christianity.**—Christianity was introduced into the country by Frumentius (*q.v.*), who was consecrated first bishop of Ethiopia by St. Athanasius of Alexandria about A.D. 330. From the scanty evidence available it would appear that the new religion at first made little progress, and the Axumite kings seem to have been among the latest converts. Towards the close of the 5th century a great company of monks established themselves in the country, and since that time monachism has been a power among the people and not without its influence on the course of events. In the early part of the 6th century the king of the Homerites, on the opposite coast of the Red Sea, having persecuted the Christians, the emperor Justinian I. requested the king of Auxume, Caleb or El-Ẽsbaha, to avenge their cause. He accordingly collected an army, crossed over into Arabia, and conquered Yemen (*c.* 525), which remained subject to Ethiopia for over 50 years. This was the most flourishing period in the annals of the country. The Ethiopians possessed the richest part of Arabia, carried on a large trade, which extended as far as India and Ceylon, and were in constant communication with the Greek empire. Their expulsion from Arabia, followed by the conquest of Egypt by the Mohammedans in the middle of the 7th century, changed this state of affairs, and the continued advances of the followers of the Prophet at length cut them off from almost every means of communication with the civilized world; so that, as Gibbon says, "encompassed by the enemies of their religion, the Ethiopians slept for near a thousand years, forgetful of the world by whom they were forgotten." About A.D. 960, a Jewish princess, Judith, conceived the design of murdering all the members of the royal family, and of establishing herself in their stead. During the execution of this project, the infant king was carried off by some faithful adherents, and conveyed to Shoa, where his authority was acknowledged and the Solomonean dynasty ruled for about 300 years; while Judith reigned for 40 years over the rest of the kingdom after which a usurping dynasty of Lasta held the reins of power (except in Shoa) until in 1268 the kingdom was restored to the royal house in the person of Yekūnō Amlāk.

**Advent of the Portuguese.**—Towards the close of the 15th century the Portuguese missions into Abyssinia began. A belief had long prevailed in Europe of the existence of a Christian kingdom in the far east, whose monarch was known as Prester John, and various expeditions had been sent in quest of it. Among others who had engaged in this search was Pedro de Covilham, who arrived in Abyssinia in 1490, and, believing that he had at length reached the far-famed kingdom, presented to the negūs, or emperor of the country, a letter from his master the king of Portugal, addressed to Prester John. Covilham remained in the country, but in 1507 an Armenian named Matthew was sent by the negūs to the king of Portugal to request his aid against the Mohammedans. In 1520 a Portuguese fleet, with Matthew on board, entered the Red Sea in compliance with this request, and an embassy from the fleet visited the negūs, Lebna Dengel or Dawit (David) II., and remained in Abyssinia for about six years. One of this embassy was Father Francisco Alvarez, from whom we have the earliest and not the least interesting account of the country. Between 1528 and 1540 armies of Mohammedans, under the renowned general Mohammed Grañ (probably a Somali), entered Abyssinia from the low country to the south-east, and overran the kingdom, obliging the emperor to take refuge in the mountain fastnesses. In this extremity recourse was again had to the Portuguese, who sent a fleet, under the command of Stephen da Gama, from India, which arrived at Massawa in Feb. 1541. In the July following a force of 450 musqueteers, under the command of Christopher da Gama, younger brother of the admiral, left the fleet and marched into the interior, and being joined by native troops were at first successful against the enemy; but they were subsequently defeated, and their commander taken prisoner and put to death (Aug 1542). On Feb. 21, 1543, however, Mohammed Grañ was shot in an engagement and his forces totally routed. After this, quarrels arose between the negūs and the Portuguese, who now wished the emperor publicly to profess himself a convert to Rome, which the negūs refused to do. The Jesuits who had accompanied or followed the da Gama expedition into Abyssinia, and fixed their headquarters at Fremona (near Adowa), were oppressed and neglected, but not actually expelled. In the beginning of the 17th century Father Pedro Paez arrived at Fremona, a man of great tact and judgment, who soon rose into high favour at court, and gained over the emperor to his faith. He directed the erection of churches, palaces and bridges in different parts of the country, and carried out many useful works. His successor Mendez was a man of much less conciliatory manners, and the feelings of the people became strongly excited against the intruders, till at length, on the death of the negūs, Socinius or Seged I., and the accession of his son Fasilidas in 1633, they were all sent out of the country, after having had a footing there for nearly a century and a half.

**Penetration of European Travellers.**—The French physician C. J. Poncet, who went there in 1698, via Sennar and the Blue Nile, was the only European that afterwards visited the country before Bruce in 1769. James Bruce's main object was to discover the sources of the Nile, which he was convinced lay in Abyssinia. Accordingly, leaving Massawa in Sept. 1769, he travelled via Axum (Aksum) to Gondar, and was well received by King Tekla Haimanot II. He accompanied the king on a warlike expedition round Lake Tana, crossing the genuine Blue Nile (Abbai) close to its point of issue from the lake. On a second expedition of his own he proved to his own satisfaction that the river originated some 40m. S.W. of the lake at a place called Geesh (Nov. 4, 1770). He showed that this river flowed into the lake, and left it by its now well-known outlet. In 1805 the first British mission under Lord Valentia and Mr. Henry Salt was sent to conclude an alliance with Abyssinia and obtain a port on the Red Sea in case France secured Egypt by dividing up the Turkish Empire with Russia. This mission was succeeded by many travellers, missionaries and merchants of all countries. Prominent amongst them were Dr. C. T. Beke (*q.v.*) who did much to extend geographical knowledge of the country from 1840 to 1843, and Mr. Mansfield Parkyns (1843–46) who wrote the most interesting book on the country since Bruce.

In 1830 Protestant missionary enterprise was begun by Samuel Gobat and Christian Kugler, who were sent out by the Church Missionary Society and were well received by the Ras of Tigré, but in 1838 most of the missionaries were obliged to leave the country owing to the opposition of the native priests. Later on, however (1856), Bishop Gobat conceived the idea of sending lay missionaries who would engage in secular occupations as well as missionary work. Their secular work appears to have been the more appreciated, and King Theodore employed them as workmen and established them at Gaffat, near his capital.

**Position of the Negusa Nagast.**—In order to obtain a clear view of native Abyssinian history, as distinct from the visits and

influence of Europeans. it must be borne in mind that during the last 300 years, and indeed for a longer period, for the old chroniclers may be trusted to have given a somewhat distorted view of the importance of the particular chieftains with whom they came in contact, the country has been merely a conglomeration of provinces and districts, ill defined, loosely connected and generally at war with each other. Of these the chief provinces have been Tigré (northern), Amhara (central), Gojam (north western) and Shoa (southern). The seat of government, or rather of overlordship, has usually been in Amhara, the ruler of which, calling himself negusa nagast (king of kings, or emperor), has exacted tribute, when he could, from the other provinces. The title of negusa nagast has been to a considerable extent based on the blood in the veins of the claimant. All the emperors have based their claims on their direct descent from Solomon and the queen of Sheba; but it is needless to say that in many, if not in most, cases their success has been due more to the force of their arms than to the purity of their lineage. Some of the rulers of the larger provinces have at times been given or have given themselves, the title of negūs or king, so that on occasion as many as three, or even more, negūses have been reigning at the same time; and this must be borne in mind by the student of Abyssinian history in order to avoid confusion of rulers. The whole history of the country is, in fact, with a few bright intervals due to the efforts of some of the more enlightened monarchs, one gloomy record of internecine wars, barbaric deeds and unstable governments, of adventurers usurping thrones, only to be themselves unseated, and of raids, rapine and pillage.

Thus, for example, though the Empire had been re-united under Yekūnō Amlāk of the Solomonean dynasty in 1268, the overlordship of the Negūs or Negusa Nagast (king of kings) had become purely nominal by the 18th century, and the rulers of Tigré and Amhara alternately held the real power. Between these two quasi-kingdoms there was perpetual hostility and much fighting, but without definite results until Kassa (later King Theodore of Magdala fame) appeared on the scene.

## KING THEODORE

**Origin and Rise.**—Lij Kassa was born in Kwara, a small district of Western Amhara, in 1818. His father was a small local chief, and his uncle was governor of the districts of Dembea, Kwara and Chelga between Lake Tana and the undefined N.W. frontier. He was educated in a monastery, but preferred a more active life, and by his talents and energy came rapidly to the front. On the death of his uncle he was made chief of Kwara, but in consequence of the arrest of his brother Bilawa by Ras Ali, he raised the standard of revolt against the latter, and, collecting a large force, repeatedly beat the troops that were sent against him by the ras (1841–47). On one occasion peace was restored by his receiving Tavavich, daughter of Ras Ali, in marriage; and this lady is said to have been a good and wise counsellor during her lifetime. He next turned his arms against the Turks, in the direction of Massawa, but was defeated; and the mother of Ras Ali having insulted him in his fallen condition, he proclaimed his independence. As his power was increasing, to the detriment of both Ras Ali and Ubié, these two princes combined against him, but were heavily defeated by him at Gorgora (on the southern shore of Lake Tana) in 1853. Ubié retreated to Tigré, and Ras Ali fled to Begemeder, where he eventually died. Kassa now ruled in Amhara, but his ambition was to attain to supreme power, and after conquering Gojam and Tigré, he proclaimed himself negusa nagast of Ethiopia under the name of Theodore III. He now turned his attention to Shoa which still remained unsubdued.

**Struggle with Shoa.**—Retracing our steps for a moment in that direction, we find that in 1813 Sahale (or Sella) Selassie, younger son of the preceding ruler of Shoa, Wassen Seged, had proclaimed himself king of Ifat, Shoa and the Galla. His reign was long and beneficent, and by his wise measures and personal generosity, and by extending his hospitality to Europeans, he brought his country within the closer ken of civilized European powers. During his reign he received the missions or Major W. Cornwallis Harris, sent by the governor-general of India (1841), and M. Rochet d'Héricourt, sent by Louis Philippe (1843), with both of whom he concluded friendly treaties on behalf of their respective governments He was succeeded in 1847 by his eldest son, Haile Melikot, who, by increasing his dominions at the expense of the Galla, and by concluding a treaty with Ras Ali against Kassa in 1850 determined the latter to crush him at the earliest opportunity.

Thus it was that in 1855 Kassa, under the name of the emperor Theodore, advanced against Shoa with a large army. Dissensions broke out among the Shoans, and after a desperate and futile attack on Theodore at Debra-Berhan, Haile Melikot died of exhaustion and fever, nominating with his last breath his 11-year-old son Menelek as successor (Nov 1855) After a hard fight, Menelek was defeated and handed over to the negūs, taken to Gondar and there trained in Theodore's service.

**Decline of Power.**—Theodore had by then reached the zenith of his career. He is described as being generous to excess, free from cupidity, merciful to his vanquished enemies, and strictly continent, but subject to violent bursts of anger and possessed of unyielding pride and fanatical religious zeal. He was also a man of intelligence, superior to those among whom he lived, with natural talents for governing and gaining the esteem of others. He had, further, a noble bearing and majestic walk, a frame capable of enduring any amount of fatigue, and is said to have been "the best shot, the best spearman, the best runner, and the best horseman in Abyssinia." Unfortunately, success turned his head, and he lost certain good influences around him by the death of his good queen Tavavich, and the murder by rebels of his two English friends and advisers, W. C. Plowden and J. T Bell, whose deaths he avenged by the slaughter of 2,000 of the rebels

His union with his second wife, Terunish, the proud daughter of the late Ras of Tigré, was a most unhappy one. and he seems to have given himself over to intoxication and lust, and to have exercised the most terrible cruelty in his campaigns against the Galla and the various districts in which rebellions broke out against him. This exhausted his strength and resources, and such of the country as he still dominated groaned under his heavy exactions.

**Quarrel with Great Britain.**—In Oct. 1862, Captain Cameron, who had been appointed in Feb. of that year to succeed Mr. Plowden as British consul, was sent home by Theodore, with a letter to the queen of Great Britain, which reached the Foreign Office on Feb 12, 1863 This letter was put aside and no answer returned, and to this in no small degree are to be attributed the difficulties that subsequently arose with that country. In Nov. despatches were received from England, but no answer to the emperor's letter, and this, together with a visit paid by Captain Cameron to the Egyptian frontier town of Kassala, greatly offended him. Accordingly in Jan. 1864 Captain Cameron and his suite, with Messrs. Stern and Rosenthal, were cast into prison. When the news of this reached England, the government resolved, when too late, to send an answer to the emperor's letter, and selected Mr. Hormuzd Rassam to be its bearer. The British party on arrival at the king's camp in Damot, on Jan. 25, 1866, were received with all honour, and were afterwards sent to Kwarata, on Lake Tana, there to await the arrival of the captives. The latter reached Kwarata on March 12 and everything appeared to proceed favourably. A month later they started for the coast, but had not proceeded far when they were all brought back and put into confinement. The Europeans, although detained as prisoners, were not at first unkindly treated; but in the end of June they were sent to Magdala, where they were soon afterwards put in chains, suffered hunger, cold and misery, and were in constant fear of death. Meanwhile one of them, Mr. Flad, had been sent by Theodore with a letter to Queen Victoria, asking for European workmen and machinery, and with a view if possible to effect the release of the prisoners by conciliatory measures, Mr. Flad was sent back, with some artisans and machinery, and a letter from the queen, stating that these would be handed over to his majesty on the release of the prisoners and their return to Massawa. This, however, failed to influence the emperor, and the British Government at length saw that they must have recourse to arms.

**Sir Robert Napier's Expedition.**—In July 1867 it was resolved to send an army into Abyssinia to enforce the release of the captives, under Sir Robert Napier (1st Baron Napier of Magdala). The landing-place selected was Mulkutto (Zula), on Annesley Bay, the point of the coast nearest to the site of the ancient Adulis, and we are told that "the pioneers of the English expedition followed to some extent in the footsteps of the adventurous soldiers of Ptolemy, and met with a few faint traces of this old-world enterprise" (C. R Markham). The force amounted to upwards of 16,000 men, besides 12,640 belonging to the transport service, and followers, making in all upwards of 32,000 men. The task necessitated a march over 400 miles of a mountainous and little-known country, inhabited by savage tribes, to the camp or fortress of Theodore. The commander-in-chief landed on Jan. 7, 1868, and soon after the troops began to move forward through the pass of Senafé, and southward through the districts of Agamé, Tera, Endarta, Wojerat, Lasta and Wadela.

In the meantime the power of Theodore in the country was rapidly waning. Shoa had already shaken off his yoke; Gojam was virtually independent; Walkeit and Simen were under a rebel chief; and Lasta, Waag and the country about Lake Ashangi had submitted to Wagshum Gobassié, who had also overrun Tigré and appointed Dejaz Kassai his governor The latter, however, in 1867 rebelled against his master and assumed the supreme power of that province. At the time when the British troops made their appearance in the country Theodore had thus been reduced to great straits. His army, which at one time numbered over 100,000 men, was rapidly deserting him, and he could hardly obtain food for his followers. He resolved to quit his capital Debra-Tabor, which he burned, and set out with the remains of his army for Magdala. During this march he displayed an amount of engineering skill in the construction of roads, of military talent and fertility of resource, that excited the admiration and astonishment of his enemies. But after a heavy defeat near Magdala on April 10, Theodore sent Lieut. Prideaux, one of the captives, and Mr. Flad, accompanied by a native chief, to the British camp to sue for peace. Answer was returned, that if he would deliver up all the Europeans in his hands, and submit to the queen of Great Britain, he would receive honourable treatment. The captives were liberated and sent away, and accompanying a letter to the British general was a present of 1,000 cows and 500 sheep, the acceptance of which would, according to Eastern custom, imply that peace was granted. Through some misunderstanding, word was sent to Theodore that the present would be accepted, and he felt that he was now safe; but in the evening he learned that it had not been received, and despair again seized him. The next day, April 13, Magdala was stormed and taken, practically without loss, and within they found the dead body of the emperor, who had fallen by his own hand. The inhabitants and troops were subsequently sent away, the fortifications destroyed, and the town burned. The queen Terunish having expressed her wish to go back to her own country, accompanied the British army, but died during the march, and her son Alamayahu, the only legitimate son of the emperor, was brought to England, as this was the desire of his father.[1] The success of the expedition was in no small degree owing to the aid afforded by the several native chiefs through whose country it passed, and no one did more in this way than Dejaz Kassa or Kassai of Tigré. In acknowledgment of this, several pieces of ordnance, small arms and ammunition, with much of the surplus stores, were handed over to him, and the British troops left the country in May 1868.

## THE EMPEROR MENELEK II.

**Early Struggles as King of Shoa.**—It is now time to return to the story of the young prince Menelek, who, as we have seen, had been nominated by his late father as ruler of Shoa, but was in Theodore's power in Tigré. In 1865, he took advantage of Theodore's difficulties with the British government and escaped to Workitu, queen of the Wollo Galla country. The emperor, who held as hostage a son of Workitu, threatened to kill the boy unless Menelek were given up; but the gallant queen refused, and lost both her son and her throne. The fugitive meanwhile arrived safely in Shoa, and was there acclaimed as negüs. For the next three years Menelek devoted himself to strengthening and disciplining his army, to legislation, to building towns, such as Liché (near Debra-Berhan), Worra Hailu (Wollo Galla country), etc., and to repelling the incursions of the Galla On the death of Theodore (April 13, 1868) many Shoans, including Ras Dargé, were released, and Menelek began to feel himself strong enough to undertake offensive operations against the northern princes But these projects were of little avail, for Kassai of Tigré, had by this time (1872) risen to supreme power in the north With the help of the rifles and guns presented to him by the British, he had beaten Ras Bareya of Tigré, Wagshum Gobassié of Amhara and Tekla Giorgis of Gondar, and after proclaiming himself negusa nagast under the name of Johannes or John, was now preparing to march on Shoa. Here, however, Menelek was saved from probable destruction through the action of Egypt. This power had, by the advice of Werner Munzinger, then the Swiss governor of Massawa, seized and occupied in 1872 the northern province of Bogos, and, later on, insisted on occupying Hamasen also, for fear Bogos should be attacked John, after futile protests, collected an army, and with the assistance of Ras Walad Michael, hereditary chief of Bogos, advanced against the Egyptian forces, who were under the command of one Arendrup, a Dane. Meeting near the Mareb, the Egyptians were beaten in detail, and almost annihilated at Gundet (Nov. 13, 1875). An avenging expedition was prepared in the spring of the following year, and, numbering 14,000 men under Ratib Pasha, Loring (American), and Prince Hassan, advanced to Gura and fortified a position in the neighbourhood. Although reinforced by Walad Michael, who had now quarrelled with John, the Egyptians were a second time (March 25, 1876) heavily beaten by the Abyssinians, and retired, losing an enormous quantity of both men and rifles. Colonel C. G. Gordon, governor-general of the Sudan, was now ordered to go and make peace with John, but the king had moved south with his army, intending to punish Menelek for having raided Gondar whilst he, John, was engaged with the Egyptians. Menelek's kingdom was meanwhile torn in twain by serious dissensions on the subject of the succession, but on the approach of John, the Shoans united for a time against their common enemy. After a few skirmishes, however, they melted away, and Menelek was obliged to submit and do obeisance to John. The latter behaved with much generosity, but at the same time imposed terms which effectually deprived Shoa of her independence (March 1878). In 1879 Gordon was sent on a fresh mission to John on behalf of Egypt; but he was treated with scant courtesy, and was obliged to leave the country without achieving anything permanent.

**Advent of the Italians.**—The Italians now come on the scene. Assab, a port near the southern entrance of the Red Sea, had been bought from the local sultan in March 1870 by an Italian company, which, after acquiring more land in 1879 and 1880, was bought out by the Italian Government in 1882. In this year Count Pietro Antonelli was despatched to Shoa in order to improve the prospects of the colony by treaties with Menelek and the sultan of Aussa; but both John and Menelek became uneasy when Beilul, a port to the north of Assab Bay, was occupied by the Italians in Jan. 1885, and Massawa taken over by them from Egypt in the following month. This latter act was greatly resented by the Abyssinians, for by a treaty concluded with a British and Egyptian mission under Admiral Hewett and Mason Pasha in the previous year, free transit of goods was to be allowed through this port. In Jan. 1887, the Abyssinians, in consequence of a refusal from General Gené to withdraw his troops, surrounded and attacked a detachment of 500 Italian troops at Dogali, killing more than 400 of them Reinforcements were sent from Italy, whilst in the autumn the British Government stepped in and tried to mediate by means of a mission under Mr. (afterwards Sir Gerald) Portal. His mission, however, proved abortive, and after many difficulties and dangers he returned to Egypt at

[1] He was subsequently sent to school at Rugby, but died in his 19th year, on Nov. 14, 1879. He was buried at St. George's Chapel, Windsor.

the end of the year. John was killed in battle against the dervishes in March 1889, when Menelek immediately claimed the Empire of Abyssinia. The new emperor brought Abyssinia for the first time under a single rule, doubled the size of the Empire by extensive conquests, and began development on European lines.

The Italian envoy Count Antonelli was with Menelek when he claimed the throne, and promptly concluded with him (May 2, 1889) on behalf of Italy a friendly treaty, to be known hereafter as the famous Uccialli treaty. In consequence of this the Italians occupied Asmara, made friends with Mangasha, reputed son and heir of King John, and received Ras Makonnen (Ras of Harar, which province had been conquered by Menelek in Jan. 1887), Menelek's nephew, as his plenipotentiary in Italy; thus it seemed as though hostilities between the two countries had come to a definite end. As, however, the Italians became more and more friendly with Mangasha and Tigré the apprehensions of Menelek increased, till at last, in Feb. 1893, he wrote denouncing the Uccialli treaty, which differed in the Italian and Amharic versions. According to the former, the negūs was bound to make use of Italy as a channel for communicating with other powers, whereas the Amharic version left it optional. Meanwhile the dervishes were threatening Eritrea. A fine action by Colonel Arimondi gained Agordat for Italy (Dec. 21, 1893), and a brilliant march by Colonel Baratieri resulted in the acquisition of Kassala (July 17, 1894).

**War with Italy.**—On his return Baratieri found that Mangasha was intriguing with the dervishes, and had actually crossed the frontier with a large army. At Koatit and Senafé (Jan. 13–15, 1895) Mangasha was met and heavily defeated by Baratieri, who occupied Adigrat in March. But as the year wore on the Italian commander pushed his forces unsupported too far to the south. Menelek was advancing with a large army in national support of Mangasha, and the subsequent reverses at Amba-Alagi (Dec. 7, 1895) and Makale (Jan. 21, 1896) forced the Italians to fall back.

Reinforcements of many thousands were meanwhile arriving at Massawa, and in Feb. 1896 Baratieri took the field at the head of over 13,000 men. Menelek's army, amounting to about 90,000, had during this time advanced, and was occupying a strong position at Abba Garima, near Aduwa (or Adowa). Here Baratieri attacked him on March 1, but the difficulties of the country were great, and one of the four Italian brigades had pushed too far forward. This brigade was attacked by overwhelming numbers, and on the remaining brigades advancing in support, they were successively cut to pieces by the encircling masses of the enemy. The Italians lost 4,600 white and nearly 3,000 native troops killed and wounded; the number of prisoners was estimated at between 2,500 and 3,000. The Abyssinians' casualties were far greater. General Baldassera advanced with a large body of reinforcements to avenge this defeat, but, beyond the peaceful relief of Adigrat no further operations took place. On Oct. 26 following, a provisional treaty of peace was concluded at Addis Ababa, annulling the treaty of Uccialli and recognizing the absolute independence of Abyssinia. (*See* ITALY: *History* and SOMALILAND.)

**Consolidation and Extension of the Empire.**—The war, so disastrous to Italy, attracted the attention of all Europe to Abyssinia and its monarch, and numerous missions, two Russian, three French, and one British, were despatched to the country, and hospitably received by Menelek. The British one, under Mr. Rennell Rodd (later Lord Rennell), concluded a friendly treaty with Abyssinia (May 15, 1897).

In 1898 Menelek subdued Mangasha and later conducted a number of expeditions in different parts of the country, notably against the Galla, and added immense provinces to the empire. An important treaty was concluded on May 15, 1902, between England and Abyssinia for the delimitation of the Sudan-Abyssinian frontier. Menelek, in addition, agreed not to obstruct the waters of Lake Tana, the Blue Nile or the Sobat, so as not to interfere with Nile irrigation. A combined British-Abyssinian expedition (Mr. A. E. Butter's) was dispatched in 1901 to propose and survey a boundary between Abyssinia on the one side and British East Africa and Uganda on the other; and the report of the expedition was made public by the British Government in Nov. 1904. It was followed in 1908 by an agreement defining the frontiers concerned. It is also an interesting fact that between 1899 and 1904 the Abyssinians co-operated with the British in their campaigns against the "Mad Mullah" of Somaliland by sending joint expeditions on no less than four occasions.

**Growth of European Influence.**—The first concession for a railway was the one from the coast at Jibuti (French Somaliland) to the interior, granted by Menelek to a French company in 1894. Difficulties arose over the continuation of the railway to Addis Ababa and beyond, and the proposed internationalization of the line. These difficulties, which hindered the work of construction for years, were composed (so far as the European Powers interested were concerned) in 1906 by the terms of an Anglo-French-Italian agreement, signed in London on Dec. 13 of that year.

Meanwhile the country slowly developed in parts and opened out cautiously to European influences and most of the Powers appointed representatives at Menelek's capital, the British minister-plenipotentiary and consul-general, Lieut.-Colonel Sir J. L. Harrington, having been appointed shortly after the British mission in 1897. But Ras Makonnen, the most capable and civilized of Menelek's probable successors, died in March 1906, and Mangasha died later in the same year; the question of the succession therefore opened up the possibility that, in spite of recent civilizing influences, Abyssinia might still relapse in the future into its old state of conflict. The Anglo-French-Italian agreement of Dec. 1906, referred to above, contained provisions in view of this contingency. The preamble of the document declared that it was the common interest of the three Powers "to maintain intact the integrity of Ethiopia," and Article I. provided for their co-operation in maintaining "the political and territorial *status quo* in Ethiopia." Should, however, the *status quo* be disturbed, the Powers were to concert to safeguard their special interests. The terms of the agreement were settled in July 1906, and its text forthwith communicated to the negūs. (E. GL.; C. F. R.)

**From 1908 to the War with Italy.**—For the first 8 of these years (1908–1916) chaos reigned, *i. e.*, during the regency of Menelek's widow Taitu and Ras Tessama, and the rule of the Emperor Lej Yasu; during the next 12 years, 1916–1928—the period of combined rule of Menelek's daughter Zauditu as Empress with Ras Tafari (later the Emperor Haile Selassie) as Regent—matters improved to some extent in spite of constant intrigue between the progressive party, supporting the Regent, and the reactionary elements led by the Empress; during the last 8 years Tafari, first of all as King (1928–1930), later as Emperor (1930–1936), had begun to introduce a measure of reform and progress into his backward and unruly empire.

**First Period—1908–1916.**—Menelek had in 1908 nominated as his successor Lej Yasu (born 1896) under the regency of one of the more enlightened Abyssinian chieftains, Ras Tessama. But the constant strife between Menelek's wife Taitu, the Regent, and the boy Emperor, made ordered government impossible. The enforced retirement of Taitu in 1910, the death of Tessama in 1911, and the complete assumption of power in that year by Yasu, merely drove matters from bad to worse.

By his misgovernment, his tyrannical and dissolute conduct, and particularly by his inclination to Islam, Lej Yasu mortally affronted his own subjects, intensely proud as they were and are of their 15 centuries of Christian tradition. His support of the "Mad Mullah" of Somaliland, who claimed him as a cousin, and his efforts to build up a federation of Muslim states, anti-ally in its sentiments, also estranged the sympathies of the three great Powers with possessions bordering on Abyssinia. In September, 1916, he was excommunicated by the Abuna, the head of the Abyssinian Church. The great Rases, thus relieved of their oath of fealty, formally deposed him, and proclaimed Zauditu, a daughter of the Emperor Menelek, born in 1876, as Empress, and Dajazmach Tafari, born July 17, 1891, son of Menelek's nephew, Ras Makonnen, as Regent of the empire, heir to the throne and Ras of Rases. Heavy fighting followed. Lej Yasu's father, Ras Mikael of Wollo Galla, raised large Galla forces to aid his son, but the troops of the deposed ruler were defeated with great slaughter at Sagalle on October 27, 1916. Ras Mikael was taken prisoner, and

Lej Yasu became a wanderer, first of all in the Danakil country and later in the province of Tigré. He was taken prisoner by Tafari in 1921, and kept in chains until his death in 1935.

**Second Period—1916–1928.**—The dual nature of the administration of empress and regent stimulated intrigue among the powerful Rases and provincial governors, who had fallen back into a state of semi-independence during the preceding years of misrule, and made effective control difficult to exercise. In spite of this, however, and of sporadic fighting with Lej Yasu's followers, Ras Tafari made substantial progress in administrative improvement; he was, however, hampered by a thoroughly bad and ineffective, though onerous, financial system, and an entire absence of men of integrity and ability to support and execute his ideas.

His distrust of the intentions of the great European limitrophe powers—England, France, and Italy—made him slow to grant concessions to or to accept financial or advisory assistance from nationals of these powers, and this further hindered development. It was largely on account of this distrust of his neighbours that Ras Tafari strove for the admission of Abyssinia to the League of Nations, which he achieved in 1923. This step was criticized as being premature in view of the backward state of development of the country, and was, in fact, opposed at first by the British representatives but ultimately approved, largely owing to the strong support accorded by the French.

Feeling more secure both internally and externally, as a result of the League membership, Ras Tafari felt able to leave Abyssinia and visit the principal European countries in 1924. Shortly afterward he appealed to the League against the Anglo-Italian agreement regarding spheres of influence in Abyssinia, concluded in December 1925, which he regarded as a violation of Abyssinian rights A visit of the duke of Abruzzi to Addis Ababa in 1927 was followed by the signature during the following year of an Italo-Abyssinian arbitration treaty of "perpetual friendship," and of a further agreement between the two countries providing for the cession to Abyssinia of the port of Assab, and for the construction of a road thence to the capital. This instrument, however, was neither published nor implemented.

Meanwhile, on October 7, 1928, Tafari caused himself to be proclaimed king with all power in his hands, leaving Zauditu to retain a nominal position as empress. On April 3, 1930, Zauditu died, and on November 2 of that year Tafari was crowned emperor.

**Third Period—1928–1936.**—From the moment when Ras Tafari assumed full power in 1928 he worked unceasingly and with a greater measure of success than before for the development of Abyssinia. Progress was, however, slow in view of the factors already described, which still existed albeit to a lesser extent. Such administrative reforms as were introduced, *e.g.*, the establishment of ministries, and the creation of a "parliament," were more theoretical than real, and had little actual effect, all power remaining, in fact, in the hands of the emperor, who however, added to his effective control of the country by removing the last of the hereditary provincial governors, Ras Hailu of Gojam, who led a rebellion against him in 1932 in favour of the deposed emperor Lej Yasu. Minor reforms in the way of educational institutions, road construction, etc., were carried out; but the financial system remained practically untouched.

Strengthened in his belief that the external position of Abyssinia was safeguarded by membership in the League of Nations, the emperor manifested little inclination to meet the views of Italy, which country was pressing for development on the lines of the Anglo-Italian Agreement of 1925 and otherwise, and was engaged in ever increasing activity in Eritrea, Italian Somaliland and along the Red sea generally.

**The Outbreak of the War with Italy.**—Wal Wal, an obscure village near the ill-defined Abyssinian-Italian Somaliland frontier, although placed in Abyssinia by most maps, had been occupied by Italian troops for several years without protest from Abyssinia. The Anglo-Abyssinian frontier delimitation commission, escorted by a force of Abyssinian troops, arrived there on November 23 1934 and came into touch with the Italians, owing to whose attitude the British mission withdrew. Italian and Abyssinian troops remained facing each other at Wal Wal until on December 5, 1934, firing took place; nine months later, in Sept 1935, the arbitrators appointed by the League of Nations agreed unanimously that neither side was guilty of aggression.

As the gravity of the issues likely to be raised by this incident became apparent, strenuous efforts to maintain peace were made by various countries, notably by England, both directly and through the machinery of the League of Nations. In Dec. 1934, Abyssinia had notified the League of Nations of the Wal Wal incident, and had appealed for League intervention under Article XI of the Covenant in Jan. 1935. In that month the two countries ostensibly agreed to seek a settlement; but, no agreement having been reached by March, Abyssinia invoked Article XV, and later demanded arbitration under the treaty with Italy of 1928.

A conference between England, France and Italy was held in Paris on August 15 to 18 but they failed to find any basis of agreement A committee of five, appointed by the League of Nations on Sept. 6 to formulate proposals, reported on the 18th; Abyssinia agreed to open negotiations on the basis of these proposals but Italy refused them. Then, when war broke out on October 3, the League condemned Italy as the aggressor, and proceeded to elaborate in October, and put in force on November 18, 1935, a scheme of financial and economic "sanctions" against Italy.

Bitter feeling was aroused in Italy by these measures, and the international aspect of the situation was rendered more delicate owing to the dispatch by Italy in September of large reinforcements to Libya; which was followed by the sending to Egypt by England of considerable numbers of troops and much war material, and the strengthening of the British fleet in the Mediterranean.

On November 6, the League committee of eighteen had adopted a resolution in favour of oil, steel and coal sanctions, and on November 25 this was supported by Rumania and Russia. But on December 13, the committee adjourned further consideration of the proposed oil sanction, which in fact was never imposed. No country appeared to be willing to consider the imposition of military sanctions.

Proposals for a peace settlement on the basis of certain territorial cessions by Abyssinia to Italy were formulated between Sir Samuel Hoare, British foreign secretary, and Pierre Laval, representing France, on December 8; submitted to Abyssinia on the 10th; and published on December 13. These had been approved by the British government, which, however, abandoned them on December 18 in view of the strong adverse public opinion in England.

On March 3, 1936 the League committee of thirteen issued an appeal to both belligerents to cease hostilities. This, however, was unavailing, and on April 20 the League council adjourned until May 11, by which time the war was over. At the session held during the week commencing June 29 (which was addressed by Emperor Haile Selassie in person) the League decided to recommend the raising of the sanctions which had been imposed on Italy as these had failed to achieve their purpose, but refused to recognize the Italian occupation of Abyssinia. Sanctions were raised in July. After that, several of the powers previously represented in Abyssinia by legations replaced them by consulates, tacitly admitting the change in status, although no general or specific recognition of Italy's possession had been given. (C. F. R.)

## FROM ITALIAN AGGRESSION TO THE NEW INDEPENDENCE

**Military Operations.**—During the period of negotiations, Italy utilized the first nine months of 1935 in equipping and assembling a large army in Eritrea and Somaliland, so that it started the campaign well prepared and with an immense superiority in every form of modern armament. The Abyssinians, to avoid any appearance of provocation, ordered mobilization only after Italian troops had crossed the frontier, without any official declaration of war, on Oct. 3. The Abyssinians were completely inferior in equipment especially because the democratic powers had again and again refused the demands of the emperor to be allowed to buy modern armaments. Thus the Italians, moving from Eritrea in the north and from Somaliland in the south, under General de Bono, who had been appointed commander in chief in Jan. 1935, had an easy task. Nevertheless it took them, in spite of their technical superiority and the general backwardness of Ethiopian organization, seven months to defeat the Ethiopian forces. As a result of slow progress General de Bono, an old time fascist, was replaced on Nov. 28 by General Badoglio. Nor was General Graziani, commanding the southern army, more successful. He could take the principal town of that part, Harar, only on May 8, while the northern army entered the capital, Addis Ababa, on May 5, 1936. The emperor

had flown on the night of May 1, and sailed via Palestine to Europe where he arrived in England.

**Italian Domination.**—Italy annexed Abyssinia on May 9, 1936, and the king of Italy was proclaimed emperor of Abyssinia. On June 1, 1936, the colony of Italian East Africa (Africa Orientale Italiana) was created comprising Abyssinia Eritrea and Italian Somaliland under one viceroy and divided into five provinces Eritrea with the capital of Asmara, Amhara with the capital of Gondar; Galla with the capital of Jimma, Harar with the capital of the same name, Somaliland with the capital of Mogadishu. A sixth province, Shoa, was later added. Each province was under a governor. The whole area was 665,977 sq mi with 12,100,000 inhabitants in 1939. The capital, Addis Ababa, with about 150,000 inhabitants, formed a district of its own.

The Italian occupation of the country was placed first under Marshal Badoglio as viceroy who, however, was succeeded after a few weeks by Marsha. Graziani. On Nov. 20, 1937, Prince Amedeo of Savoy, duke of Aosta, became viceroy The Italian administration tried to improve the economic production of the country and built a number of good motor roads Yet in spite of very large Italian forces maintained in the country, the Abyssinians continued to fight for their independence. Unrest did not subside for some of the less accessible parts of the country, and it was kept alive by the cruel methods which the fascists applied. In March 1937 bombs were thrown at Addis Ababa which wounded the viceroy. As a result the Italians established a reign of terror and thousands of natives were massacred and executed. Though a number of Italian settlers were brought to Ethiopia, the country in no way fulfilled the great economic expectations which the fascists had heralded to the world in 1935 By the beginning of 1939 the Italian fascists raised the demand for the annexation of French Somaliland with the port of Djibouti, to Italian East Africa

**Abyssinia in World War II.**—With the outbreak of World War II in 1939 the importance of Abyssinia for Italian strategy increased considerably, because it was generally supposed, as the fascists had often given to understand, that, in case of Italy's entrance into the conflict, Italian armies from Libya and Abyssinia would take the British position in Egypt and the Sudan into a great pincer movement and thus definitely establish the longed-for great Italian empire. On May 9, 1940, the anniversary of the proclamation of the new empire, bellicose and boastful speeches were made by the fascists in Rome and Count Grandi declared that the Italian people "powerful in its arms, strong in its right, conscious of its mission, formed from the Alps to the Indian ocean a compact army of 45,000,000 soldiers." When on June 10 Italy declared war against "the plutocratic and reactionary democracies of the west," it became however, quickly clear how unfounded the fascist boasts had been and on how weak feet of clay the proud Italian empire in Abyssinia was built.

The complete inefficiency of the numerically superior Italian naval forces in the Mediterranean, which for the first year of the war left the control of the sea in British hands, was responsible for the cutting off of the Italian army in Abyssinia from home supply. Nevertheless there was a very considerable Italian army in Abyssinia, magnificently equipped, at least on paper. (*See* WORLD WAR II.)

**The Liberation of Abyssinia.**—On July 12, 1940, the British government officially recognized Ethiopia as an ally and promised its liberation in case of victory. Emperor Haile Selassie left Great Britain in the same month and began to organize Ethiopian resistance from the Sudan. It is true that the Italians, as a result of their great numerical superiority, were able to occupy, in Aug. 1940, British Somaliland. But soon the tide was to turn. The Italians had to abandon Kassala, the only town in the Sudan near the frontier, which they succeeded in occupying in 1940. On Jan. 15, 1941 Emperor Haile Selassie crossed the border into Ethiopia; patriot forces began to gather around him and played an important role in the liberation of their country A British army under General Sir Alan Gordon Cunningham moved from the south into Italian Somaliland The operations started by the end of January and by the end of March not only had the whole of Italian Somaliland been captured, but also British Somaliland reconquered.

Meanwhile British forces from the Sudan, who under General Platt had entered Eritrea, had made their victory secure by the capture of Cheren on March 27, and of Asmara on March 31. The patriot armies under the emperor had approached from Debra Markos the centre of the country which was threatened simultaneously from the south by General Cunningham's quick advance On April 6 the capital, Addis Ababa, was in British hands The Italian troops under the duke of Aosta withdrew to the north and resisted for a few weeks longer before they surrendered at Amba Alagi on May 19. Two major pockets of resistance remained, at Jimma in the south under General Pietro Gazzera and at Gondar in the north under General Guglielmo Nasi. The last to surrender was that at Gondar. This fortified position was taken by storm by patriot troops on Nov. 27. Thus the war ended in a complete disaster for fascist Italy, the dream of empire had gone, the hated Italian domination of Abyssinia was over and the liberty of the ancient empire could be restored. More than 100,000 Italians were taken prisoners, among them the duke of Aosta. The British victory made the Suez canal safe from attack from the south, and opened the Red sea to American shipments for Egypt and the middle east. In Dec. 1941 the American government began to build a great supply base in Eritrea.

On May 5, 1941 Emperor Haile Selassie re-entered Addis Ababa, exactly five years after the Italians had occupied the city. He had been the first of the heads of state expelled by the fascist conquerors and forced to go into exile. He was also the first to return. As a legacy from the time of the Italian occupation he found a modernized capital and much improvement in road communications which with British help will facilitate the modernization of Abyssinia's administration, the great task set before the emperor For a transitory period a dual British and Abyssinian control was instituted There were about 40,000 Italian civilians in the country. It should be pointed out that in spite of the easily understandable feelings of the Ethiopians against their fascist oppressors, no serious disorders occurred and the Italian civilians continued their occupations peacefully until circumstances made their evacuation possible.

On Feb 3, 1942 the British foreign secretary announced the conclusion of a two-power pact between Britain and Abyssinia which provided for a British military mission and British advisers to the emperor, a loan of $10,000,000 and the presence of British judges in Ethiopian courts. R G Howe was appointed British minister to Abyssinia, and at the end of Aug. 1942 the Abyssinian minister, Ayalla Gabre, arrived in London. At the same time all British troops left Abyssinia, as the pacification of the country had been completed and the new native administration firmly established. (H Ko.)

**ABYSSINIAN CHURCH.** As the chronicle of Axum relates, Christianity was adopted in Abyssinia in the 4th century. About A.D. 330 Frumentius was made first bishop of Ethiopia by Athanasius, patriarch of Alexandria. Little is known of church history down to the period of Jesuit rule, which broke the connection with Egypt from about 1500 to 1633.

Early in the 16th century the church was brought under the influence of a Portuguese mission. The initiative in the Roman Catholic missions to Abyssinia was taken by Portugal, as an incident in the struggle with the Muslims for the command of the trade route to India by the Red sea. In 1507 Matthew, or Matheus, an Armenian, had been sent as Abyssinian envoy to Portugal to ask aid against the Muslims, and in 1520 an embassy under Dom Rodrigo de Lima landed in Abyssinia.

Generally the Abyssinians agree with the Copts in ritual and practice (*see* COPTS). The Septuagint was translated into the literary language, which is used for all services, though hardly understood. Saints and angels are highly revered, if not adored, but graven images are forbidden. Fasts are long and rigid. Confession and absolution, strictly enforced give great power to the priesthood. Pilgrimage to Jerusalem is a religious duty and covers many sins.

For an account written shortly before World War I see Dowling, *The Abyssinian Church* (1909). The account of Alvarez was translated and edited for the Hakluyt Society by Lord Stanley of Alderley under the title *Narrative of the Portuguese Embassy to Abyssinia* (1881).

With reference to present social and political conditions, *see* ABYSSINIA. On the architecture, *see* J. C. Hotten, *Abyssinia Described* (1868), and (especially with reference to monuments of heathen origin) Bent, *The Sacred City of the Ethiopians* (1896).

**ACACIA,** a genus of trees and shrubs belonging to the pulse or pea family (Leguminosae, sub-family Mimosoideae), comprises a group of about 550 species widely distributed over the warmer regions of the world, but particularly abundant in Australia and Africa. The leaves are usually twice compounded (bipinnate, *see* fig.); in some instances, notably with Australian species indigenous to arid localities, the leaflets are suppressed, their stalks (petioles) then becoming flattened and acquiring the physiological functions of leaves. These stalks are commonly vertically disposed, an orientation which precludes the inception of intense sunlight, thus apparently preventing injury through the retardation of excessive surface evaporation. The small, frequently fragrant flowers are arranged in rounded or elongated clusters. The several seeded pod-like fruits are either flattened or cylindrical, often with constrictions between the seeds. Sharp spines arm the branchlets of many forms.

FLOWERING BRANCH AND POD OF ACACIA SENEGAL, ONE OF 550 SPECIES OF ACACIA WIDELY DISTRIBUTED IN WARM REGIONS; A SENEGAL PRODUCES GUM ARABIC

True gum arabic is the product of *Acacia senegal,* a native of both east and west tropical Africa. The Indian *A. arabica* yields a similar gum, but of inferior quality. Catechu (*q.v.*) or cutch is procured from *A. catechu* and several other species. Extractions from finely divided wood of this tree are employed in dyeing khaki cloth.

The barks of most acacias are rich in tannin. *Babul* or *babool,* derived from *A. arabica,* is used in northern India for tanning. The Australian wattle barks, but especially golden wattle (*A. pycnantha*), silver wattle (*A. dealbata*), and tan wattle (*A. decurrens*), are important sources of tannin and collectively form an important article of export. The fruit pods of neb-neb (*A. nilotica*) and other African species are other sources of this astringent. Seeds of the South American *A. niopo* are processed and used as snuff.

A few acacias are productive of valuable timber. Australian blackwood (*A. melanoxylon*) is a highly figured wood of cabinet rank. Myall (*A homalophylla,* also Australian) yields a fragrant, decorative wood. Koa (*A. koa*), a native of the Sandwich Islands, produces a handsomely figured wood known to many through its use in the manufacture of ukuleles. *A. heterophylla* from Mauritius and Bourbon is another excellent timber tree. The biblical shittah tree (*A. seyal*) is also a member of this group Species noted for their heavily developed spines include the Australian kangaroo-thorn (*A. armata*), the African camel-thorn (*A. giraffae*), and the Central American bull-thorn acacia (*A. sphaerocephala*). The large thorn-like stipules of *A. spadicigera* (Central America) are hollow and provide shelter for ants which feed on leaf-stalk secretions and curious food-bodies at the tips of leaflets. Sweet acacia (*A. farensiana*) of the southwestern United States has been introduced into India and southern Europe Its fragrant, yellow flowers are used in making perfume.

The term acacia has been applied to species of the genus *Robinia* (*q.v.*), also a member of the Leguminosae. The American black locust (*Robinia pseudoacacia*) is the false acacia so widely cultivated in milder parts of Britain. (E. S. HR.)

**ACADÉMIE NATIONALE DE MUSIQUE,** the official title of the Paris Opéra, also known as the Théâtre National de l'Opéra, founded by Louis XIV in 1669 and the most famous institution of its kind in the world. Lully, an Italian by birth but naturalized as a Frenchman, was the first composer of note associated with the Académie, of which he obtained control in 1672. Later Rameau became director and produced there nearly all of his many operas, and he was succeeded by Gluck as ruling spirit with Piccinni as his rival. Other eminent composers prominently identified with the Paris Opéra subsequently included Spontini, Cherubini, Rossini, Meyerbeer, Auber, Gounod, Saint-Saëns and Massenet. The present building of the Paris Opéra, opened in 1875 and one of the most magnificent of its kind in existence, succeeded two others, both of which were destroyed by fire. Closely associated with the Paris Opéra is the Conservatoire de Musique, founded in 1784 under the name École royale de chant et de déclamation for the purpose of training opera singers and later widened in scope to include musical teaching and training of every kind.

**ACADEMIES.** The word "academy" is derived from "the olive grove of Academe, Plato's retirement" (*see* under ACADEMY, GREEK). The schools of Athens after the model of the Academy continued to flourish almost without a break for nine centuries till they were abolished by a decree of Justinian "Academy," in its modern acceptation, may be defined as a society or corporate body having for its object the cultivation and promotion of literature, of science and of art, either severally or in combination, undertaken for the pure love of these pursuits, with no interested motive. Modern academies, moreover, have, almost without exception, some form of public recognition; they are either founded, endowed or subsidized, or at least patronized, by the supreme head of the State. The term "academy" has been loosely used in modern times. In the 18th century it was frequently adopted by schools run by dissenters, and the name is often found attached to the public schools in Scotland and Northern Ireland We are only concerned here, however, with those institutions which are of historical importance in their various spheres.

BY COURTESY OF THE METROPOLITAN MUSEUM OF ART

A RENAISSANCE CONCEPTION OF A GREEK ACADEMY. FROM A 16TH CENTURY WOODCUT BY FRANCESCO MARCOLINI AFTER THE PAINTING, "THE ACADEMY OF KNOWLEDGE," BY GIUSEPPE PORTA

The first academy, as thus defined, though it might with equal justice claim to be the first of universities, was the museum of Alexandria founded at the beginning of the 3rd century B C. by the first of the Ptolemies. There all the sciences then known were pur-

sued, and the most learned men of Greece and of the East gathered. Here, too, was the nucleus of the famous library of Alexandria. Modern literary academies may be said to trace their lineage in direct descent from the troubadours of the early 14th century. The first floral games were held at Toulouse in May, 1324, at the summons of a gild of troubadours, who invited "honourable lords, friends and companions who possess the science whence spring joy, pleasure, good sense, merit and politeness" to assemble in their garden of the "gay science" and recite their works. These floral games survived till about the year 1500 In 1694 the *Académie des Jeux Floraux* was constituted an academy by letters patent of Louis XIV. Suppressed during the Revolution it was revived in 1806, and still continues to award amaranths of gold and silver lilies, for which there is keen competition.

Provence led the way, but Italy of the Renaissance is the soil in which academies most grew and flourished. The *Accademia Pontaniana,* to give it its subsequent title, was founded at Florence in 1433 by Antonio Beccadelli of Palermo and fostered by Laurentius Valla. Far more famous was the *Accademia Platonica,* founded *c.* 1442 by Cosimo de' Medici, which numbered among its members Marsilio Ficino, Pico della Mirandola, Machiavelli and Angelo Poliziano. It was, as the name implies, chiefly occupied with Plato, but it added to its objects the study of Dante and the purification of the Italian language, and though it lived for barely half a century yet its influence as a model for similar learned societies was great and lasting.

## I. SCIENTIFIC ACADEMIES

**Austria.**—The *Akademie der Wissenschaften* at Vienna, originally projected by Leibnitz, was founded by the emperor Ferdinand I. in 1846, and has two classes—mathematics and natural science, and history and philology.

**Belgium and the Netherlands.**—A literary society founded at Brussels in 1769 by Count Charles de Cobenzl, minister plenipotentiary of Maria Theresa, became in 1816 the *Académie royale des sciences et des Beaux-Arts de Belgique*, under the patronage of William I of the Netherlands. In 1834 it became *Académie Royale de Belgique*, while the Dutch portion took the name of the *Koninklijk Nederlander Institut.* The Royal Institute of the Low Countries was founded in 1808 by King Louis Bonaparte It was replaced in 1851 by the *Koninklijke Akademie van Wetenschappen* at Amsterdam, to which in 1856 a literary section was added.

**Denmark.**—The *Kongelige danske videnskabernes selskab* (Royal Academy of Sciences) at Copenhagen owes its origin to Christian VI. (1742). It developed into a sort of learned club. The king took it under his protection, enlarged its scope by the addition of natural history, physics and mathematics, and in 1743 constituted it a royal academy with an endowment fund.

**France.**—The old *Académie des sciences* had the same origin as the more celebrated *Académie française.* A number of men of science had for some 30 years met together. They included Descartes, Gassendi, Blaise and Etienne Pascal. Hobbes, the author of *Leviathan,* was presented to it during his first visit to Paris in 1640. Colbert conceived the idea of giving an official status to this learned club. A number of chemists, physicians, anatomists and eminent mathematicians—among whom were Christian Huyghens and Bernard Frenicle de Bessy (1605–75), the author of a famous treatise on magic squares—were chosen to form the nucleus of the new society. Pensions were granted by Louis XIV. to each of the members, and a fund for instruments and experiment was placed at their disposal. They began their session on Dec. 22, 1666, in the royal library. At first the academy was rather a laboratory and observatory than an academy proper. Several foreign *savants,* in particular the Danish astronomer Roemer, joined the society; and the German physician and geometer, Tschirnhausen, and Sir Isaac Newton were made foreign associates. After the death of Colbert the labours of the academicians were diverted from the pursuit of pure science to such works as the construction of fountains and cascades at Versailles, and the mathematicians were employed to calculate the odds of the games of lansquenet and basset. In 1699 the academy was reconstituted. By its new constitution it consisted of 25 members, ten honorary, men of high rank interested in science, and 15 pensionaries, who were the working members. Of these three were geometricians, three astronomers, three mechanicians, three anatomists and three chemists Each of these three had two associates, and, besides, each pensionary had the privilege of naming a pupil. There were eight foreign and four free associates. The constitution was purely aristocratical, differing in that respect from that of the French Academy, in which the principle of equality among the members was never violated. The leading spirits of the academy at this period were Clairault, Réaumur and Fontenelle, the popularizer of science. In the 18th century other prominent members were Laplace, Buffon, Lagrange, D'Alembert, Lavoisier and Jussieu, the father of modern botany It was suppressed on April 8, 1793.

In 1795 the Convention decided on founding an *Institut National* which was to replace all the academies. In 1816 the *Académie des sciences* was reconstituted as a branch of the Institute. The new academy has reckoned among its members, besides many other brilliant men, Carnot the engineer, the physicists Fresnel, Ampère, Arago, Biot, the chemists Gay-Lussac and Thénard, the zoologists G. Cuvier and the two Geoffroy Saint-Hilaires. In France there were also academies in most of the large towns. Montpellier, for example, had a royal academy of sciences, founded in 1706 by Louis XIV , reconstituted in 1847, and organized under three sections—medicine, science and letters There were analogous institutions at Toulouse, Nîmes, Arles, Lyons, Dijon, Bordeaux and elsewhere.

**Germany.**—The *Collegium Curiosum* was a scientific society, founded by J. C. Sturm, professor in the University of Altorf, in Franconia, in 1672, on the plan of the Accademia del Cimento. It originally consisted of 20 members, and continued to flourish long after the death of its founder. Two volumes (1676–85) of proceedings were published by Sturm. The former, *Collegium Experimentale sive Curiosum,* begins with an account of the diving-bell, "a new invention"; next follow chapters on the camera obscura, the Torricellian experiment, the air-pump, microscope, telescope, etc. It is now extinct.

The *Preussische Akademie der Wissenschaften* in Berlin holds the first place in Germany. Its origin was the *Societas Regia Scientiarum* constituted in 1700 by Frederick I. on the comprehensive plan of its first president, Leibnitz. It was reorganized under Frederick II. on the French model furnished by Maupertuis, and received its present constitution in 1812. It is divided into two classes and four sections—physical and mathematical, philosophical and historical. Among the contributors to its transactions (first volume published in 1710), to name only the dead, we find Immanuel Bekker, Böckling, Bernoulli, F. Bopp, P. Buttmann, Encke (of comet fame), L. Euler, the brothers Grimm, the two Humboldts, Lachmann, Lagrange, Leibnitz, T. Mommsen, J. Müller, G. Niebuhr, C. Ritter (the geographer), Savigny and Zumpt. To the *Berlin Academy* we owe the *Corpus Inscriptionum Graecarum,* the *Corpus Inscriptionum Latinarum,* and the *Monumenta Germaniae Historica.*

The *Bayerische Akademie der Wissenschaften,* at Munich, founded in 1759, is distinguished by the part it has played in national education. Maximilian Joseph, the enlightened elector (afterwards king) of Bavaria, induced the Government to hand over to it the organization and superintendence of public instruction, and this work was carried out by Privy-councillor Jacobi, the president of the academy. In recent years the academy has specially occupied itself with natural history.

The *Preussische Akademie gemeinnütziger Wissenschaften,* at Erfurt, which dates from 1754 and devotes itself to applied science, and the Hessian academy of sciences at Giessen, which publishes medical transactions, also deserve mention.

**Great Britain and Ireland.**—In 1616 a scheme for founding a royal academy was started by Edmund Bolton, an eminent scholar and antiquary, who in his petition to King James I. proposed that the title of the academy should be "King James, his Academe or College of honour." A list of the proposed original members is still extant, and includes the names of George Chapman, Michael Drayton, Ben Jonson, John Selden, Sir Kenelm Digby and Sir Henry Wotton. The death of King James put an

end to the undertaking. About 1645 the more ardent followers of Bacon used to meet, some in London, some at Oxford, for the discussion of subjects connected with experimental science. This was the original of the Royal Society (*q.v.*) which received its charter in 1662.

A society was formed in Dublin similar to the Royal Society in London, as early as 1683; but it was short-lived. The Royal Irish Academy grew from a society established in Dublin about 1782 by a number of gentlemen, most of whom belonged to the university The first volume of transactions appeared in 1788.

**Hungary.**—The *Magyar Tudományos Társasay* (Hungarian Academy of Sciences) was founded in 1825 by Count Stephen Széchenyi for the encouragement of the study of the Hungarian language and the various sciences. It has a fine building in Budapest containing a picture gallery and housing various national collections.

**Italy.**—The *Academia Secretorum Naturae* was founded at Naples in 1560 by Giambattista della Porta. The condition of membership was to have made some discovery in natural science. Della Porta was suspected of practising the black arts and summoned to Rome to justify himself before the papal court. He was acquitted on those charges by Paul V., but commanded to close his academy.

The *Academia dei Lincei* was founded in 1603 by Federigo Cesi, the marchese di Monticelli. Galileo and Colonna were among its earliest members. As a monument the Lincei have left the magnificent edition of Fernandez de Oviedo's *Natural History of Mexico* (Rome, 1651, fol ), printed at the expense of the founder and elaborately annotated by the members This academy was resuscitated in 1870 under the title of *Reale Accademia Nazionale dei Lincei,* with a literary as well as a scientific side, endowed in 1878 by King Humbert, and in 1883 it received official recognition from the Italian Government, being thereafter lodged in the Corsini palace, whose owner made over to it his valuable library and collections.

The *Accademia del Cimento* was founded at Florence in 1657 by Leopold de' Medici, brother of the grand duke Ferdinand II., at the instigation of Vincenzo Viviani, the geometrician. It was an academy of experiment, a deliberate protest against the deductive science of the quadrivium. It lasted only ten years, but the grand folio published in Italian (afterwards translated into Latin) in 1667 is a landmark in the history of science. It contains experiments on the pressure of the air (Torricelli and Borelli were among its members), on the incompressibility of water and on universal gravity.

Other pre-eminent Italian Academies are the new *Reale Accademia d'Italia,* and the *Reale Accademia delle Scienze di Torino.* The latter was founded in 1757 as a private society by a group of learned men (among whom was Joseph Louis la Grange), and incorporated by royal warrant in 1783. It consists of 60 *Soci Nazionali,* 20 *Soci Stranieri,* and 160 *Soci Corrispondenti.* It publishes volumes of *Memorie* and a yearly volume of proceedings, and awards prizes for learned works. There are, besides, royal academies of science at Naples, Lucca and Palermo.

**Portugal.**—The *Academia Real das Sciencias* (now *Acad. das Sciencias de Lisboa*) dates from 1779. It was reorganized in 1851 and since then has been chiefly occupied in the publication of *Portugaliae Monumenta Historica.*

**Russia.**—The *Académie Impériale des sciences de Saint-Petersbourg* (*Imperatorskaya Akademiya naük*), was established on Dec. 21, 1725, by Catherine I. Shortly afterwards the empress settled a fund of £4,982 per annum for the support of the academy; and 15 eminent members were admitted and pensioned, under the title of professors in the various branches of science and literature. The most distinguished of these were Nicholas and Daniel Bernouilli, the two Delisles, Bilfinger and Wolff. At the accession of Elizabeth the original plan was enlarged and improved; learned foreigners were drawn to St. Petersburg (Leningrad); and, what was considered a good omen for the literature of Russia, two natives, Lomonosov and Rumovsky, men of genius who had prosecuted their studies in foreign universities, were enrolled among its members. The annual income was increased to £10,659. Catherine II. utilized the academy for the advancement of national culture. By her recommendation the most intelligent professors visited all the provinces of her vast dominions, with most minute and ample instructions to investigate the natural resources, conditions and requirements, and report on the real state of the empire. The result was that no country at that time could boast, within so few years, such a number of excellent official publications on its internal state, its natural productions, its topography, geography and history, and on the manners, customs and languages of the different tribes that inhabited it, as came from the press of this academy. In its researches in Asiatic languages, oriental customs and religions, it proved itself the worthy rival of the Royal Asiatic Society in England. The first transactions, *Commentarii Academiae Scientiarum Imperialis Petropolitanae ad annum* 1726, with a dedication to Peter II., were published in 1728. In 1747 the transactions were called *Novi Commentarii Academiae,* etc.; and in 1777, *Acta Academiae Scientiarum Imperialis Petropolitanae.* The papers, hitherto in Latin only, were now written indifferently in Latin or in French. Of the *Commentaries,* 14 volumes were published; of the *New Commentaries* (1750–76) twenty. Of the *Acta Academiae* two volumes are printed every year. In 1872 there was published at St. Petersburg, in 2 vols., the valuable *Tableau général des matières contenues dans les publications de l'Académie Impériale des Sciences de St. Petersbourg* The academy of to-day has three divisions: (1) physical and mathematical sciences; (2) Russian language and literature; (3) historical science and philology A large number of laboratories and museums are affiliated to it, as well as a physico-mathematical and an Indo-European Institute. The Asiatic museum and the mineralogical museum are housed in this building, and also the academical botanical museum. The vast library of the Academy of Sciences is situated in a separate building, erected 1718–25. Its scientific publications are exempt from censorship and include transactions of its various sections, a monthly and a yearly journal. These are edited by the scientific staff of the academy, but published by the Soviet Government Publishing Department.

**Spain.**—The *Real Academia Española* at Madrid (*see* below) had a predecessor in the *Academia Naturae curiosorum* (dating from 1657) modelled on that of Naples. It was reconstituted in 1847 after the model of the French Academy.

**Sweden.**—The *Kongliga Svenska Vetenskaps-academien* owes its institution to six persons of distinguished learning, among whom was Linnaeus. In 1739 they formed a private society, the *Collegium Curiosorum.* In March 1741 it was incorporated as the Royal Swedish Academy. Though under royal patronage and largely endowed, it is, like the Royal Society in England, entirely self-governed. The dissertations read at each meeting are published in the Swedish language, quarterly, and make an annual volume. The first 40 volumes, octavo, completed in 1779, are called the *Old Transactions.*

Norway has an active Academy of Sciences at Oslo; Japan has an Imperial Academy at Tokyo; Yugoslavia has two academies, one Serbian at Belgrade and one Yugoslav at Zagreb. Czechoslovakia has the Czech Academy of Sciences and Arts at Prague.

## II. ACADEMIES OF BELLES LETTRES

**Belgium.**—Belgium has always been famous for its literary societies. The little town of Diest boasts that it possessed a society of poets in 1302, and the Catherinists of Alost date from 1107. It is at least certain that numerous chambers of rhetoric (so academies were then called) existed in the first years of the rule of the house of Burgundy.

**France.**—The French Academy (*l'Académie française*) was established by order of the king in the year 1635, but in its original form existed four or five years earlier. About the year 1629 certain literary friends in Paris agreed to meet informally each week. The conversation turned mostly on literary topics; and when one of the number had finished some literary work he read it to the rest, and they gave their opinions upon it. The fame of these meetings, though the members were bound to secrecy, reached the ears of Cardinal Richelieu, who promised his protec-

tion and offered to incorporate the society by letters patent. These were granted by the king on Jan. 29, 1635. The officers consisted of a director and a chancellor, chosen by lot, and a permanent secretary, chosen by vote. The director presided at the meetings, being considered as *primus inter pares*. The chancellor kept the seals and sealed all the official documents of the academy. The cardinal was *ex officio* protector.

The number of members was fixed at 40, but it was not till 1639 that the full number was completed. Their first undertaking consisted of essays written by the members in rotation. Next, at the instance of Cardinal Richelieu, they undertook a criticism of Corneille's *Cid*, the most popular work of the day. It was a rule of the academy that no work could be criticized except at the author's request, but fear of incurring the cardinal's displeasure wrung from Corneille an unwilling consent. The critique of the academy was re-written several times before it met with the cardinal's approbation. After six months of elaboration it was published under the title, *Sentiments de l'académie française sur le Cid*. This judgment did not satisfy Corneille, as a saying attributed to him on the occasion shows. "*Horatius*," he said, referring to his last play, "was condemned by the Duumviri, but he was absolved by the people." But the crowning labour of the academy, begun in 1639, was a dictionary of the French language. By the 26th article of their statutes they were pledged to compose a dictionary, a grammar, a treatise on rhetoric and one on poetry. Jean Chapelain, one of the original members, drew up a plan for compiling the dictionary, which was to a great extent carried out. C. F. de Vaugelas was appointed editor-in-chief. The first edition of this dictionary appeared in 1694, the sixth and last in 1835, since when *compléments* have been added.

**Reconstruction.**—The old *Académie* perished with other pre-revolutionary academies in 1793, and it has little but the name in common with the present academy, a section of the institute. The object of the Convention in 1795 was, as already stated, to rebuild all the institutions that the Revolution had shattered and to combine them in an organic whole. The institute was at first composed of 184 members resident in Paris and an equal number living in other parts of France, with 24 foreign members, divided into three classes: (1) physical and mathematical science, (2) moral and political science, (3) literature and the fine arts. It held its first sitting on April 4, 1796. Napoleon as first consul suppressed the second class, as subversive of government, and reconstituted the other classes as follows: (1) as before, (2) French language and literature, (3) ancient history and literature, (4) fine arts. The class of moral and political science was restored on the proposal of M. Guizot in 1832, and the present institute consists of the five classes named above. Each class or academy has its own special jurisdiction and work, with special funds; but there is a general fund and a common library, which, with other common affairs, are managed by a committee of the institute—two chosen from each academy, with the secretaries.

The class of the institute which deals with the language and literature takes precedence, and is known as the *Académie française*. There was at first no perpetual secretary, each secretary of sections presiding in turn. Shortly afterwards J. B. Suard was elected to the post, and ever since the history of the academy has been determined by the reigns of its successive perpetual secretaries. The secretary, to borrow an epigram of Sainte-Beuve, both reigns and governs. Among the best known in the 19th century were Suard, François Juste Raynouard, François Andrieux and Villemain. Under Raynouard the academy ran a tilt against the abbé Delille and his followers. Under Auger it did battle with romanticism, "a new literary schism." Auger did not live to see the election of Lamartine in 1829, and it needed ten more years for Victor Hugo after many vain assaults to enter by the breach. The academy is professedly non-political. It accepted and even welcomed in succession the empire, the restoration and the reign of Louis Philippe, and it tolerated the republic of 1848; but to the Second Empire it offered a passive resistance, and no politician of the Second Empire, whatever his gifts as an orator or a writer, obtained an armchair. The one seeming exception, Emile Ollivier, confirms the rule. He was elected on the eve of the Franco-German War, but his *discours de réception*, a eulogy of the emperor, was deferred and never delivered. The institute has large vested funds in property, including the magnificent estate and library of Chantilly bequeathed to it by the duc d'Aumale. It awards various prizes, of which the most considerable are the Montyon prizes, each of 20,000frs., one for the poor Frenchman who has performed the most virtuous action during the year, and one for the French author who has published the book calculated to prove of most service to morality.

A point of considerable interest is the degree in which, since its foundation, the French Academy has or has not represented the best literary life of France. It appears from an examination of the lists of members that a surprising number of authors of the highest excellence have, from one cause or another, escaped the honour of academic "immortality." When the academy was founded in 1634, the moment was not a very brilliant one in French letters. Among the 40 original members we find only ten who are remembered in literary history; of these four may reasonably be considered famous still—Balzac, Chapelain, Racan and Voiture. In that generation Scarron was never one of the 40, nor do the names of Descartes, Malebranche or Pascal occur. The one astounding omission of the 17th century, however, is the name of Molière, who was excluded by his profession as an actor; but the academy has made the *amende honorable* by placing in the *Salle des séances* a bust of Molière, with the inscription "*Rien ne manque à sa gloire, il manquait à la nôtre.*" On the other hand, the French Academy was never more thoroughly representative of letters than when Boileau, Corneille, La Fontaine, Racine and Quinault were all members. Of the great theologians of that and the subsequent age, the academy included Bossuet, Fléchier, Fénelon and Massillon, but not Bourdaloue. La Bruyère and Fontenelle were among the 40, but not Saint-Simon, whose claims as a man of letters were unknown to his contemporaries. Early in the 18th century almost every literary personage of eminence found his place naturally in the academy. The only exceptions of importance were Vauvenargues, who died too early for the honour, and two men of genius but of dubious social position, Le Sage and the abbé Prévost d'Exiles. The approach of the Revolution affected gravely the *personnel* of the academy. Montesquieu and Voltaire belonged to it, but not Rousseau or Beaumarchais. Of the Encyclopaedists, the French Academy opened its doors to D'Alembert, Condorcet, Volney, Marmontel and La Harpe, but not to Diderot, Rollin, Condillac, Helvétius or the Baron d'Holbach. Apparently the claims of Turgot and of Quesnay did not appear to the academy sufficient, since neither was elected. In the transitional period, when the social life of Paris was distracted and the French Academy provisionally closed, neither André Chénier nor Benjamin Constant nor Joseph de Maistre became a member. In the early years of the 19th century considerations of various kinds excluded from the ranks of the 40 the dissimilar names of Lamennais, Prud'hon, Comte and Béranger. Critics of the French Academy are fond of pointing out that neither Stendhal, nor Balzac, nor Théophile Gautier, nor Flaubert, nor Zola penetrated into the Mazarine palace. It is not so often remembered that writers so academic as Thierry and Michelet and Quinet suffered the same exclusion. In later times neither Alphonse Daudet nor the brothers de Goncourt, nor Guy de Maupassant were members. Verlaine, although a poet of genius, was of the kind that no academy can ever be expected to recognize.

Concerning the influence of the French Academy on the language and literature, the most opposite opinions have been advanced. Thus Matthew Arnold, in his *Essay on the Literary Influence of Academies*, has pronounced a glowing panegyric on the French Academy as a high court of letters, and a rallying-point for educated opinion, as asserting the authority of a master in matters of tone and taste. To it he attributes in a great measure that thoroughness, that openness of mind, that absence of vulgarity which he finds everywhere in French literature; and to the want of a similar institution in England he traces that eccentricity, that provincial spirit, that coarseness which, as he thinks, are barely compensated by English genius. Thus, too, Renan, one of its most distinguished members, says that owing to the academy "one

can say everything in the language of well-bred persons without being pedantic. Do not say they have done nothing, these obscure devotees of culture who spend their lives in investigating the credentials of words and weighing up syllables. They have produced a masterpiece—the French language." On the other hand, its inherent defects have been vigorously summed up by P. Lanfrey in his *Histoire de Napoléon.* The truth probably lies midway between the two extremes. Like all national institutions, the French Academy is a rather conservative body to which only people of a certain age and with well established reputations are elected. As a protest against such a state of things, the *Académie Goncourt* was founded by E. de Goncourt in 1896. It contains ten academicians whose principal function is to award an annual prize of 5,000 francs, preferably to a young novelist. None the less, since 1890, the *Académie française* may be said to have been fairly representative of the nation's culture. Among the critics may be cited, Brunetière Lemaître, Foguet; among the poets, Sully Prudhomme, Richepin, de Regnier, Valery; among the novelists, Bourget, Anatole France, Loti, Prevost; among the dramatists, Hervieu, Curel, Rostand, Brieux; among the historians, Masson, Vandal, Hanotaux, etc.; among the philosophers, Boutroux and Bergson. Of the writers best known abroad who have not been elected members of the academy are Maeterlinck, Romain Rolland, Proust and Gide.

**Germany.**—Of the German literary academies the most celebrated was *Die Fruchtbringende Gesellschaft* (the Fruitful Society), established at Weimar in 1617. Five princes were among the original members. The object was to purify the mother tongue. The German academies copied those of Italy in their quaint titles and petty ceremonials, and exercised little permanent influence on the language or literature of the country. Other noteworthy modern societies are the *Berlinsche Gesellschaft für Deutsche Sprache,* the *Deutsche Shakespeare Gesellschaft,* and the *Goethe Gesellschaft.*

**Italy.**—Italy in the 16th century was remarkable for the number of its literary academies. Tiraboschi, in his *History of Italian Literature,* has given a list of 171; and Jarkius, in his *Specimen Historiae Academiarum Conditarum,* enumerates nearly 700. Many of these, with a sort of Socratic irony, gave themselves ludicrous names, or names expressive of ignorance. Such were the *Lunatici* of Naples, the *Estravaganti,* the *Fulminales,* the *Trapessati,* the *Drowsy,* the *Sleepers,* the *Anxious,* the *Confused,* the *Unstable,* the *Fantastic,* the *Transformed,* the *Ethereal.* "The first academies of Italy chiefly directed their attention to classical literature. . . . It was not till the writings of Bembo furnished a new code of criticism in the Italian language that they began to study it with the same minuteness as modern Latin" (Hallam, *Int. to Lit. of Europe*). The Italian nobility, excluded as they mostly were from politics, and living in cities, found in literature a consolation and a career. Such academies were oligarchical in their constitution; they encouraged culture, but tended to hamper genius and extinguish originality. Far the most celebrated was the *Accademia della Crusca* or *Furfuratorum;* that is, of bran, or of the sifted, founded in 1582. The title was borrowed from a previous society at Perugia, the *Accademia degli Scossi,* of the well-shaken. Its device was a sieve; its principal object the purification of the language. Its great work was the *Vocabulario della Crusca,* printed at Venice in 1612. It was composed avowedly on Tuscan principles, and regarded the 14th century as the Augustan period of the language. Paul Beni assailed it in his *Anti-Crusca,* and this exclusive Tuscan purism has disappeared in subsequent editions. The *Accademia della Crusca* is now incorporated with two older societies—the *Accademia degli Apatici* (the Impartials) and the *Accademia Florentina.*

Among the numerous other literary academies of Italy we may mention the Academy of Naples, founded about 1440 by Alphonso, the king; the Academy of Florence, founded 1540, to illustrate and perfect the Tuscan tongue, especially by the close study of Petrarch; the *Intronati* of Siena, 1525; the *Infiammati* of Padua, 1534; the *Rozzi* of Siena, suppressed by Cosimo, 1568. In 1690 the *Accademia degli Arcadi* was founded at Rome, for the purpose of reviving the study of poetry, by Crescimbeni, the author of a history of Italian poetry. Its members came to its meetings masked and dressed like Arcadian shepherds. Within ten years from its establishment the number of academicians was 600. The Royal Academy of Savoy was founded in 1719, and made a royal academy by Charles Albert in 1848. Its emblem was a gold orange-tree full of flowers and fruit; its motto "Flores fructusque perennes," the same as that of the famous Florimentane Academy, founded at Annecy by St. Francis de Sales. It published valuable memoirs on the history and antiquities of Savoy. Mention should also be made of the *Società Dantesca Italiana.*

**Spain.**—The *Real Academia Española* at Madrid held its first meeting in July 1713, in the palace of its founder, the duke d'Escalona. In 1714 the king granted them the royal confirmation and protection. The number of its members was limited to 24; the duke d'Escalona was chosen director for life, but his successors were elected yearly, and the secretary for life. Their object, as marked out by the royal declaration, was to cultivate and improve the national language. They were to begin with choosing carefully such words and phrases as have been used by the best Spanish writers; noting the low, barbarous or obsolete ones; and composing a dictionary wherein these might be distinguished from the former. Another important Spanish Academy is the *Real Academia de la Historia* at Madrid.

### III. ACADEMIES OF ARCHAEOLOGY AND HISTORY

**France.**—The old *Académie des inscriptions et belles-lettres* (or *"Petite Académie,"* founded in 1663) was an offshoot of the French Academy, which then at least contained the *élite* of French learning. Louis XIV. was of all French kings the one most occupied with his own aggrandisement. Literature, and even science, he encouraged only so far as they redounded to his own glory. Thus it was that the Academy of Inscriptions arose. At the suggestion of Colbert a company (a committee we should now call it) had been appointed by the king, chosen from the French Academy, charged with the office of furnishing inscriptions, devices and legends for medals. It consisted of four academicians: Chapelain, then considered the poet laureate of France; the abbé Amable de Bourzeis (1606–71); François Charpentier (1620–1702), an antiquary of high repute, and the abbé Jacques de Cassagnes (1636–79). Their meetings were principally occupied with discussing the inscriptions, statues and pictures intended for the decoration of Versailles; and their first published work was a collection of engravings, accompanied by descriptions, designed for some of the tapestries at Versailles. Later Félibien, the learned architect, and the two great poets Racine and Boileau, were added to their number. A series of medals was commenced, entitled *Médailles de la Grande Histoire,* or, in other words, the history of *Le Grand Monarque.*

But it was to M. de Pontchartrain, comptroller-general of finance and secretary of State, that the academy owed its institution. By a new regulation, dated July 16, 1701, the *Académie royale des inscriptions et médailles* was instituted, being composed of ten honorary members, ten pensioners, ten associates, and ten pupils. In 1716 the regent changed its title to that of the *Académie des inscriptions et belles-lettres,* a title which better suited its new character.

In the great battle between the ancients and the moderns which divided the learned world in the first half of the 18th century, the Academy of Inscriptions naturally espoused the cause of the ancients, as the Academy of Sciences did that of the moderns. During the earlier years of the French Revolution the academy continued its labours uninterruptedly; and on Jan. 22, 1793, the day after the death of Louis XVI., we find in the *Proceedings* that M. Bréquigny read a paper on the projects of marriage between Queen Elizabeth and the dukes of Anjou and Alençon. On Aug. 2 of the same year the last séance of the old academy was held.

In the first draft of the new institute, Oct. 25, 1795, no class corresponded exactly to the old Academy of Inscriptions; but most of the members who survived found themselves re-elected either in the class of moral and political science, under which history and geography were included as sections, or more generally under the class of literature and fine arts, which embraced an-

cient languages, antiquities and monuments. In 1816 the academy received again its old name. Perhaps the subjects on which it has shown most originality are comparative mythology, the history of science among the ancients, and the geography and antiquities of France. The old academy has reckoned among its members De Sacy the orientalist, Dansse de Villoison (1750–1805) the philologist, Anquetil du Perron the traveller, Guillaume J. de C. L. Sainte-Croix and du Theil the antiquaries, and Le Beau, who has been named the last of the Romans. The new academy included the names of Champollion, A. Rémusat, Raynouard, Burnouf and Augustin Thierry.

In consequence of the attention of several literary men in Paris having been directed to Celtic antiquities, a *Celtic Academy* was established in that city in 1805. It still exists as *La société nationale des antiquaires de France.*

**Great Britain.**—The British Academy was the outcome of a meeting of the principal European and American academies, held at Wiesbaden in Oct. 1899. A scheme was drawn up for an international association of the academies of the world under the two sections of natural science and literary science, but while the Royal Society adequately represented England in science there was then no existing institution that could claim to represent England in literature. A separate society was therefore formed entitled "The British Academy for the promotion of historical, philosophical and philological studies," which on Aug. 8, 1902, was incorporated by royal charter. The objects of the academy are therein defined: "the promotion of the study of the moral and political sciences, including history, philosophy, law, politics and economics, archaeology and philology." The number of fellows (so all members are entitled) is restricted to 150 and the academy is governed by a president and a council of 15 elected annually by the fellows.

The published *Proceedings of the British Academy* amount already to 12 volumes. Other publications are *Sp[illegible] Papers* (1911, etc.) and the annual *Schweich Lectur[illegible]* archaeology, inaugurated in 1908. *The Fund* has also enabled the academy to forward the work of excavation in Bible lands. The series of *Social and Economic Records* under the direction of Sir Paul Vinogradoff was started in 1908. with the support of a Government grant. The publication, by the Clarendon Press, of the facsimile *Old Testament of the Codex Sinaiticus* (1911–22) was made possible by an anonymous gift. The academy has also published a facsimile of the Caedman ms.

In 1908 the academy organized the commemoration of the tercentenary of Milton's birth. It is helped by the foundation of the annual Master Mind lecture (one of a number of endowments, under the will of the late Henriette Hertz). In 1927 it celebrated its 25th anniversary, the hon. secretary, Sir Israel Gollancz, having held uninterrupted office since the beginning. Among other endowments may be mentioned the annual Shakespeare lecture, the annual Raleigh lectures on history, the Warton lecture on English poetry; the Philosophical lecture; the Italian lecture; the lecture on aspects of art; the lecture on English philology and literary history; the Cromer prize for Greek essay; the biennial prize for English studies. The academy administers also the Rose Mary Crawshay prize fund for English literature, an annual prize of £100 awarded to a woman of any nationality for work on English literature.

The school of oriental studies, now an integral part of the University of London, was largely the outcome of a scheme submitted to the academy in 1904 by the late Prof. Rhys Davids. The organization of imperial studies, now recognized in London and in other British universities, was directly due to proposals made by Sir Sidney Low to the academy in 1912. The English Place-Name Society, founded in 1921 to carry out the survey of English place-names, was inaugurated under the auspices of the British academy in 1923, as the result of a statement submitted by Prof. A. Mawer, now director of the society. The foundation of the British School of Archaeology in Jerusalem in 1919 was brought about by the academy, in conjunction with the Palestine exploration fund. The establishment of the British school at Jerusalem must take an important place among the more recent efforts of the academy. Among its recent excavations are those on the Hill of Ophel at Jerusalem, the results of which confirm the view as to the site of the city of David. Meanwhile remarkable discoveries have been made in the Near East. Among the enterprises promoted by the academy is the *Encyclopaedia of Islam* (1908, etc.).

The academy is closely associated with the newly established Union Academique Internationale. The principal proposals of the Union in which the academy is concerned are the following: (a) *Corpus vasorum* (1922, etc); (b) *Catalogue of Alchemical mss.* (1926, etc.); (c) *Dictionary of Mediaeval Latin;* (d) *Forma Orbis Romani;* and (e) supplements to the *Corpora Inscriptionum graecarum et latinarum.*

**Italy.**—The *Accademia Ercolanese* (*Academy of Herculaneum*) was established at Naples about 1755, at which period a museum was formed of the antiquities found at Herculaneum, Pompeii and other places, by the marquis Tanucci. Its object was to explain the paintings, etc., discovered at those places, and for this purpose the members met every fortnight. The first volume of their labours appeared in 1775, and they have been continued under the title of *Antichità di Ercolano.* They contain engravings of the principal paintings, statues, bronzes, marble figures, medals, utensils, etc., with explanations. In the year 1807 an academy of history and antiquities, on a new plan, was established at Naples by Joseph Bonaparte, but the subsequent changes in the political state of Naples prevented the full and permanent establishment of this institution. In the same year an academy was established at Florence for the illustration of Tuscan antiquities, which published some volumes of memoirs.

## IV. ACADEMIES OF MEDICINE AND SURGERY

**Austria.**—The Academy of Surgery at Vienna was instituted in 1784 by the emperor Joseph II. under the direction of the distinguished surgeon, Giovanni Alessandro Brambilla (1728–1800). In 1874 it ceased to exist; its functions had become mainly military and were transferred to newer schools.

**France.**—Charlemagne is said to have established a school of medicine in the Louvre, and various societies have been founded and privileges granted to the faculty by his successors. The *Académie de médecine* succeeded to the old *Académie royale de chirurgie et société royale de médecine* in 1820. The new academy was divided into three sections—medicine, surgery and pharmacy. In its constitution it closely resembled the *Académie des sciences.*

**Germany.**—The *Academia Naturae Curiosi,* afterwards called the *Academia Caesaraea Leopoldina,* was founded in 1662 by J. L. Bausch, a physician of Leipzig. The works of the *Naturae Curiosi* were at first published separately; but from 1784 this appeared annually under the title of *Ephemerides.* In 1687 the emperor Leopold took the society under his protection, and its name was changed in his honour. This academy has no fixed abode, but follows the home of its president. Its library remains at Dresden.

## V. ACADEMIES OF THE FINE ARTS

**France.**—The *Académie royale de peinture et de sculpture* at Paris was founded by Louis XIV. in 1648, under the title of *Académie royale des beaux arts,* to which was afterwards united the *Académie d'architecture,* founded 1671. It is composed of painters, sculptors, architects, engravers and musical composers. From among the members of the society who are painters, is chosen the director of the French *Académie des beaux arts* at Rome, also instituted by Louis XIV. in 1677. The director's province is to superintend the studies of the painters, sculptors, etc., who, chosen by competition, are sent to Italy at the expense of the Government, to complete their studies in that country. The *Académie nationale de musique* (*q.v.*) is the official and administrative name given in France to the grand opera.

**Great Britain.**—The Royal Academy of Arts in London, founded in 1768, is described in a separate article. (*See* ACADEMY, ROYAL.)

The *Academy of Ancient Music* was established in London in 1710, with the view of promoting the study and practice of vocal and instrumental harmony. About 1734 the academy became a

seminary for the instruction of youth in the principles of music and the laws of harmony. The *Royal Academy of Music* was formed for the performance of operas, composed by Handel and conducted by him at the theatre in the Haymarket. A contest between Handel and Senesino, one of the performers, in which the directors took the part of the latter, occasioned the dissolution of the academy after it had existed with honour for more than nine years. The present *Royal Academy of Music* dates from 1822, and was incorporated in 1830. It instructs pupils of both sexes in music. (*See* also the article CONSERVATOIRE for colleges of music.)

The *Royal Academy of Dramatic Art* (incorporated in 1920), was originally founded by Beerbohm Tree in 1904. It provides a thorough training for the stage. Like the Royal Academy and the Royal College of Music it receives a grant of £500 a year from the Government. It awards annually certain scholarships, and also prepares for the diploma in dramatic art of London university. A somewhat similar institution is the School of Speech Training and Dramatic Art (incorporated), founded by Miss E. Fogerty, which also prepares for the stage.

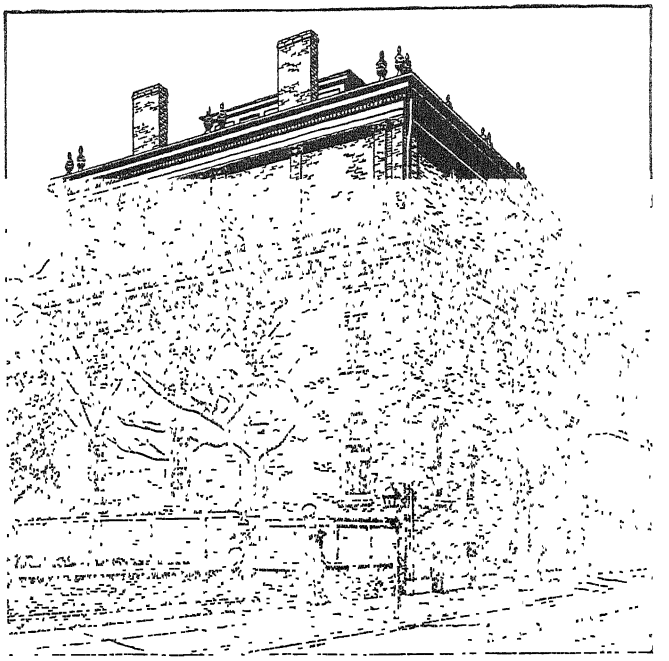
**Italy.**—In 1778 an academy of painting and sculpture was established at Turin. In Milan an academy of architecture was established so early as 1380, by Gian Galeazzo Visconti. About the middle of the 18th century an academy of the arts was established there, after the example of those at Paris and Rome. Before the effects of the French Revolution reached Italy this was one of the best establishments of the kind in that kingdom. The academy of the arts, which had been long established at Florence, fell into decay, but was restored at the end of the 18th century. But the treasures of this and the other institutions for the fine arts were greatly diminished during the occupation of Italy by the French. There are also academies of the fine arts in Mantua, Venice and Naples.

**Russia.**—The academy of St. Petersburg was established in 1757 by the empress Elizabeth, at the suggestion of Count Shuvalov, and annexed to the academy of sciences. It is now known as the *Akademiya Nauk Soyuza Sovetskich Sociallisticheskich Respublik.*

**South America.**—There are several small academies in the various towns of South America, the most important being that of Rio de Janeiro, founded by John VI. of Portugal in 1816 and now known as the *Escola Nacional de Bellas Artes.*

**Spain.**—In Madrid an academy for painting, sculpture and architecture, the *Academia de Bellas Artes de San Fernando,* was founded by Philip V. The minister for foreign affairs is president. Prizes are distributed every three years. In Cadiz a few students are supplied by the Government with the means of drawing and modelling from figures; and such as are not able to purchase the requisite instruments are provided with them.

**Sweden.**—An academy of fine arts was founded at Stockholm in the year 1733 by Count Tessin. Such students as display distinguished ability obtain pensions from the Government, to enable them to reside in Italy for some years for the purposes of investigation and improvement. In this academy there are nine professors and generally about 400 students.



**Austria.**—In the year 1705 an academy of painting, sculpture and architecture was established at Vienna, with the view of encouraging and promoting the fine arts.

*See* also SOCIETIES, LEARNED.

The volume of excerpts from the general catalogue of books in the British Museum, "Academies," five parts and index, furnishes a complete bibliography. *See* also *Minerva* published in Berlin and Leipzig and *Index Generalis* published in Paris. (C. BR.)

**United States.**—The early organization of scholars in America took a form frankly imitative of that prevalent in Europe. Academies were organized in Philadelphia and Boston in the 18th century, which, like their European prototypes, were divided into different classes. Election to membership in them was in recognition of scholarly or scientific attainment, and they still closely resemble their European counterparts

American scientists and scholars, however, have found their most effective organization in societies and associations of open membership, described in the article on Learned Societies. These frequently maintain a national headquarters at either Washington, D.C., or New York city, co-ordinate the work of the affiliated societies throughout the United States and even Canada and often issue an annual or quarterly publication, sometimes in addition to a more popular monthly magazine. There are, for example, the Archaeological Institute of America, organized in 1879, and the American Federation of Arts, which was organized in 1909 to further art in the United States by means of lectures, exhibitions and publications. There are, too, many so-called academies, clubs, societies, guilds, leagues and associations devoted to the

BY COURTESY OF AMERICAN PHILOSOPHICAL SOCIETY

ORIGINAL BUILDING AT PHILADELPHIA OF THE AMERICAN PHILOSOPHICAL SOCIETY FOR THE PROMOTION OF USEFUL KNOWLEDGE FOUNDED IN 1727 BY BENJAMIN FRANKLIN

preservation, study and furtherance of the fine arts, the physical and natural sciences, natural scenery and historic landmarks and to the improvement of cities (see *American Art Annual,* v. XXIV., 1927). Finally, there are various Federal, State and municipal art commissions that generally supervise the embellishment of public works.

Of the American organizations the following most nearly approximate the European *academy* as it has been considered here: The American Academy of Arts and Letters was organized in 1904 from within the membership of the National Institute of Arts and Letters. Founded in 1898 by members of the American Social Science Association, the National Institute of Arts and Letters now has a membership limited to 250 and divided into three sections: literature, art and music. To be elected to the Institute a candidate must be proposed by a member of his own group and receive a vote of the majority of his section and later a majority vote of those present at the annual meeting. Its executive office is in the Academy building at 633 West 155th street, New York city. The American Academy of Arts and Letters operates under a Federal charter. It is limited to 50 members, chosen from the membership of the Institute only. Unlike the Institute, it functions as a whole and a literary man is not necessarily elected to fill the chair formerly occupied by a literary man. Apart from the honour conferred by membership, the actual work of the Academy is to promote American literature and art by giving the stamp of its approval of the best that both the past and the present have to offer, by means of public addresses, by bringing to the United States representatives of other Academies and, through conferences and discussion, thereby helping to establish a literary and artistic entente between nations, and through its exhibitions, publications, collections and awards.

The American Academy of Arts and Sciences, Boston, the second oldest scientific society in the United States, was chartered in 1780 by a group of distinguished citizens of Massachusetts, including John and Samuel Adams and John Hancock. The membership is divided into three classes, covering the physical and mathematical, the natural and physiological, and the moral and political sciences. It includes fellows (limited to 600), associates and foreign honorary members, elected on the basis of recognition of scholarship or professional eminence. The academy publishes *Proceedings* and *Memoirs*. It administers various trust funds in aid of physical and chemical research, and awards the Rumford medal to the authors of "any important discovery or useful improvement in light or heat which shall have been made in any part of America." It has a commodious building but no considerable endowment. The library is rich in the fields of physics, chemistry, mathematics and in the publications of learned societies of other countries.

The American Philosophical Society Held at Philadelphia for Promoting Useful Knowledge is the oldest scientific association in the United States. The society is the outgrowth of the Junto founded by Franklin in 1727. In 1743 Franklin published *A Proposal for Promoting Useful Knowledge among the British Plantations in America*, which was so favourably received that in the same year the society was organized, with Thomas Hopkinson (1709–51) as president and Franklin as secretary. In 1769 it united with another scientific society founded by Franklin, called the American Society Held at Philadelphia for Promoting Useful Knowledge, and adopted its present name, adding the descriptive phrase from the title of the American Society, and elected Franklin president, an office which he held until his death (1790) The American Philosophical Society is national in scope and comprehends all departments of learning; its *Transactions* date from 1771, and its *Proceedings* from 1838. It has a hall in Philadelphia with meeting-rooms and a valuable library and collection of interesting portraits and relics. David Rittenhouse was its second and Thomas Jefferson its third president. In 1786 John Hyacinth de Magellan, of London, presented a fund, the income of which was to supply a gold medal for the author of the most important discovery "relating to navigation, astronomy or natural philosophy (mere natural history excepted)."

The National Academy of Sciences (1863) was incorporated by Congress with the object that it "shall, whenever called upon by any department of the Government, investigate, examine, experiment and report upon any subject of science or art." Its membership was first limited to 50; after the amendment of the act of incorporation in 1870 the limit was placed at 100; and in 1907 it was prescribed that the resident membership should not exceed 150 in number, no more than ten members to be elected in any one year, and that the number of foreign associated be restricted to 50. The constitution was later amended to provide that the membership shall not exceed 250 and that not more than 15 members shall be elected at one annual meeting. The academy is divided into ten sections: mathematics, astronomy, engineering, chemistry, geology and palaeontology, botany, zoology and anatomy, physiology and pathology, anthropology and psychology. It gives several gold medals for meritorious researches and discoveries, and holds also a number of small trust funds, from the income of which grants are made for scientific research. It publishes scientific and biographical memoirs, an annual report and monthly proceedings.

The National Academy of Design was founded in 1826 and incorporated in 1828. The first president was Samuel Finley Breese Morse, a portrait painter who subsequently invented the telegraph. The number of "associates" is unlimited but the number of "academicians" is limited to 125 painters, 25 sculptors and 25 architects or engravers. Two exhibitions are given annually and each member is entitled to exhibit one work without approval by the jury of selection.

The American Institute of Architects was chartered in 1857 with Richard Upjohn as president and Richard M. Hunt as secretary. It merged with the Western Association of Architects (founded 1884) in 1889 and has since been national in scope. Since 1902 admission to membership has required an accredited diploma, or scholarship, or passing an examination either technical or on the candidate's work and standing An annual convention is held and an annuary and monthly journal are issued.

ACADEMY, GREEK, or ACADEMIC, the name given to the philosophic school founded by Plato. The name is derived from a pleasure garden or gymnasium situated in the suburb of the Ceramicus on the river Cephissus about a mile to the north-west of Athens from the gate called Dipylum. It was said to have belonged to the ancient Attic hero Academus, who, when the Dioscuri invaded Attica to recover their sister Helen, carried off by Theseus, revealed the place where she was hidden. Out of gratitude the Lacedaemonians, who reverenced the Dioscuri, always spared the Academy during their invasions of the country. It was walled in by Hipparchus and was adorned with walks, groves, and fountains by Cimon (Plut. *Cim.* 13), who bequeathed it as a public pleasure ground to his fellow citizens. Subsequently the garden became the resort of Plato (*q.v.*) who had a small estate in the neighbourhood Here he taught for nearly 50 years till his death in 348 B C, and his followers continued to make it their headquarters. It was closed for teaching by Justinian in A D. 529 along with the other pagan schools. Cicero borrowed the name for his villa near Puteoli, where he composed his dialogue, *The Academic Questions*.

The Platonic Academy (proper) lasted from the days of Plato to those of Cicero, and during its whole course there is traceable a distinct continuity of thought which justifies its examination as a real intellectual unit. On the other hand, this continuity of thought is by no means an identity. The Platonic doctrine was so far modified in the hands of successive scholarchs that the Academy has been divided into either two, three or five main sections (Sext. Empir. *Pyrrh. Hyp.* i. 220). Finally, in the days of Philo, Antiochus and Cicero, the metaphysical dogmatism of Plato had been changed into an ethical syncretism which combined elements from the Scepticism of Carneades and the doctrines of the Stoics; it was a change from a dogmatism which men found impossible to defend, to a probabilism which afforded a retreat from Scepticism and intellectual anarchy. Cicero represents at once the doctrine of the later Academy and the general attitude of Roman society when he says, "My words do not proclaim the truth, like a Pythian priestess; but I conjecture what is probable, like a plain man; and where, I ask, am I to search for anything more than verisimilitude?" And again: "The characteristic of the Academy is never to interpose one's judgment, to approve what seems most probable, to compare together different opinions, to see what may be advanced on either side and to leave one's listeners free to judge without pretending to dogmatize."

The passage from Sextus Empiricus, cited above, gives the general view that there were three academies: the first, or Old, academy under Speusippus and Xenocrates; the second, or Middle, academy under Arcesilaus and Polemon; the third, or New, academy under Carneades and Clitomachus. Sextus notices also the theory that there was a fourth, that of Philo of Larissa and Charmidas, and a fifth, that of Antiochus. Diogenes Laertius says that Lacydes was the founder of the New Academy (i. 19, iv. 59). Cicero (*de Orat.* iii. 18, etc.) and Varro insist that there were only two academies, the Old and the New. Those who maintain that there is no justification for the five-fold division hold that the agnosticism of Carneades was really latent in Plato, and became prominent owing to the necessity of refuting the Stoic *criterion*.

The general tendency of the Academic thinkers was towards practical simplicity, a tendency due in large measure to the inferior intellectual capacity of Plato's immediate successors. Cicero (*de Fin.* v. 3) says generally of the Old Academy: "Their writings and method contain all liberal learning, all history, all polite discourse; and besides they embrace such a variety of arts that no one can undertake any noble career without their aid . . . In a word the Academy is, as it were, the workshop of every artist." It is true that these men turned to scientific investigation, but in so doing they escaped from high altitudes in which Plato thought, and tended to lay emphasis on the mundane side of philosophy.

Of Plato's originality and speculative power, of his poetry and enthusiasm they inherited nothing, "nor amid all the learning which has been profusely lavished upon investigating their tenets is there a single deduction calculated to elucidate distinctly the character of their progress or regression" (Archer Butler, *Lect. on Anc. Phil* ii, 315)

The modification of Academic doctrine from Plato to Cicero may be indicated briefly under four heads.

(1) Plato's own theory of Ideas was not accepted even by Speusippus and Xenocrates. They argued that the Good cannot be the origin of things, inasmuch as Goodness is only found as an attribute of things. Therefore, the idea of Good must be secondary to some other more fundamental principle of existence. This unit Speusippus attempted to find in the Pythagorean number theory. From it he deduced three principles, one for numbers, one for magnitude, one for the soul. The Deity he conceived as that living force which rules all and resides everywhere. Xenocrates, though like Speusippus infected with Pythagoreanism, was the most faithful of Plato's successors. He distinguished three spheres, the sensible, the intelligible, and a third compounded of the two, to which correspond respectively, sense, intellect and opinion ( δόξα ). Cicero notes, however, that both Speusippus and Xenocrates abandon the Socratic principle of hesitancy.

(2) Up to Arcesilaus, the Academy accepted the principle of finding a general unity in all things, by the aid of which a principle of certainty might be found. Arcesilaus, however, broke new ground by attacking the very possibility of certainty. Socrates had said, "This alone I know, that I know nothing." But Arcesilaus went farther and denied the possibility of even the Socratic minimum of certainty: "I cannot know even whether I know or not." Thus from the dogmatism of the master the Academy plunged into the extremes of agnostic criticism.

(3) The next stage in the Academic succession was the moderate scepticism of Carneades, which owed its existence to his opposition to Chrysippus, the Stoic. To the Stoical theory of *apprehensible* (or *knowable*) *presentation,* by which they expressed a conviction of certainty arising from impressions so strong as to amount to real knowledge, he opposed the doctrine of *inapprehensible* (or *unknowable*) *presentation,* which denied any necessary correspondence between perceptions and the objects perceived. He saved himself, however, from absolute scepticism by the doctrine of probability or verisimilitude, which may serve as a practical guide in life. Thus his criterion of imagination is that it must be credible, irrefutable, and attested by comparison with other impressions; it may be wrong, but for the person concerned it is valid. In ethics he was an avowed sceptic. During his official visit to Rome he gave public lectures, in which he successively proved and disproved with equal ease the existence of justice.

(4) In the last period we find a tendency not only to reconcile the internal divergences of the Academy itself, but also to connect it with parallel growths of thought. Philo of Larissa endeavours to show that Carneades was not opposed to Plato, and further that the apparent antagonism between Plato and Zeno was due to the fact that they were arguing from different points of view. From this syncretism emerged the prudent noncommittal eclecticism of Cicero, the last product of Academic development.

For detailed accounts of the Academicians *see* ARISTOTLE, XENOCRATES, OF CHALCEDON, etc., also STOICS and NEOPLATONISM. Histories of philosophy by Erdmann, Zeller, and Windelband, and Th. Gomperz, *Greek Thinkers,* ii, 270 (Eng. trans., 1905).

**ACADEMY, ROYAL.** The Royal Academy of Arts in London, to give it the original title in full, was founded in 1768, "for the purpose of cultivating and improving the arts of painting, sculpture and architecture." It was the outcome of many attempts which had previously been made in England to form a society which should have for its object the advancement of the fine arts. No time was lost in establishing the schools, and on Jan. 2, 1768, they were opened at some rooms in Pall Mall, a little eastward of the site now occupied by the Junior United Service club, the president, Sir Joshua Reynolds, delivering on that occasion the first of his famous "Discourses." The opening of the first exhibition at the same place followed on April 26.

The government of the academy was by the "Instrument" vested in "a president and eight other persons, who shall form a council." Four of these were to retire every year, and the seats were to go by rotation to every academician. The number was increased in 1870 to 12, and reduced to ten in 1875. The rules as to retirement and rotation are still in force Newly elected academicians begin their two years' service as soon as they have received their diploma. The council has, to quote the "Instrument," "the entire direction and management of the business" of the academy in all its branches, and also the framing of new laws and regulations; but the latter, before coming into force, must be sanctioned by the general assembly of academicians and approved by the sovereign. The original number of academicians was fixed in the "Instrument" at 40, and has so remained. Each academician on his election has to present an approved specimen of his work—called his diploma work—before his diploma is submitted to the sovereign for signature. On receiving his diploma he signs the Roll of Institution as an academician, and takes his seat in the general assembly. The class of associates, out of whom alone the academicians can be elected, was founded in 1769.

One of the most important functions of the Royal academy, and one which for nearly a century it discharged alone was the instruction of students in art. The first act, as has been shown, of the newly founded academy was to establish schools—"an Antique Academy," and a "School for the Living Model" for painters, sculptors and architects. A school of painting was added in 1815, and special schools of sculpture and architecture in 1871. The schools consist of an antique school, a school of painting, a school of drawing from the life, a school of modelling from the life and an architectural school. Admission is gained by submitting specimens of drawing or modelling, and the successful candidates, called probationers, have then to undergo a further test in the schools, on passing which they are admitted as students for five years. Female students were first admitted in 1860. There are permanent curators and teachers in all the schools, but the principal teaching is done by the keeper and visitors—academicians and associates—elected to serve in each school.

Another of the principal objects to which the profits of the Royal academy have been devoted has been the relief of distressed artists and their families. The source from which have been derived the funds for carrying on the varied work of the Royal academy, its schools, its charities and general cost of administration, and which has enabled it to spend large sums on building, and provided it with the means of maintaining the buildings, has been the annual exhibitions. There is an annual winter exhibition of works by old masters and deceased British artists, and a summer exhibition of works by living artists.

**Presidents of the Royal Academy.**—Sir Joshua Reynolds, 1768–92; Benjamin West (resigned), 1792–1805; James Wyatt, 1805; Benjamin West (re-elected), 1806–20; Sir Thomas Lawrence, 1820–30; Sir Martin Archer Shee, 1830–50; Sir Charles Lock Eastlake, 1850–65; Sir Francis Grant, 1866–78; Frederic, Lord Leighton of Stretton, 1878–96; Sir John Everett Millais, 1896; Sir Edward John Poynter, Bt., 1896–1918; Sir Aston Webb, 1919–24; Sir Frank Dicksee, 1924–28; Sir W. Llewellyn, 1928–38; Sir E. Lutyens, 1938–44; Sir Alfred Munnings, 1944– .

The library of about 11,000 volumes, some of them of great rarity and value, is open daily to the students and members, and to others on introduction. The trust funds administered by the Royal academy include the following: The Turner fund, the Creswick fund, the Landseer fund, the Armitage fund, the Leighton bequest and the Edward Stott fund.

BIBLIOGRAPHY.—The literature concerning the Royal academy consists chiefly of pamphlets and articles of more or less ephemeral value. More serious works are: William Sandby, *The History of the Royal Academy of Arts* (1862) (withdrawn from circulation on a question of copyright); *Report from the Select Committee on Arts and their Connection with Manufactures, with the Minutes of Evidence and Appendix* (1836); *Report of the Royal Commission on the Royal Academy, with Minutes of Evidence and Appendix* (1863); Martin Archer Shee, *The Life of Sir M. A. Shee, P.R.A.* (1860); C. R. Leslie, R.A., and Tom Taylor, *Life and Times of Sir Joshua Reynolds, P.R.A.* (1865); J. E. Hodgson, R.A., and F. A. Eaton, Sec. R.A. *The Royal Academy and its Members, 1768–1830* (1905). But the chief sources

of information on the subject are the minute-books of the council and of the general assembly, and the annual reports, which, however, only date from 1859. (F. A. E.; W. R. M. L.)

**ACADEMY OF NATURAL SCIENCES OF PHILADELPHIA, THE,** founded in 1812, possesses a library of 120,000 volumes and 7,000,000 natural history specimens. Its free museum contains 19 habitat groups of animals, as well as a Hall of Earth History and exhibits of birds, minerals and insects. The academy's scientific staff is comprised of 48 research scientists. It has published the *Proceedings* continuously since 1841, in addition to *The Manual of Conchology* and *Frontiers*. From 1929 to 1939, 200 expeditions sought new specimens in all parts of the world for its collections. Since 1876 The American Entomological society has been affiliated with it.

**ACADIA** or **ACADIE,** a district in what is now Nova Scotia and eastern New Brunswick, so named either because Verrazano called a part of the coast *Arcadia* in 1524, or from the Micmac *acadie*, fertile land, found in several place names. Visited by Champlain in 1603 and by De Monts in 1604, and colonized by France, Acadia was a bone of contention in the wars between France and England. It became English under the treaty of Utrecht in 1713. In 1755 the imminence of war with France, the vexed question of the neutrality of the Acadians and their possible revolt, led to the forcible deportation of the majority of the Nova Scotia Acadians (about 6,500). Their settlements were destroyed and those not deported driven into the wilderness. This deportation is the theme of Longfellow's *Evangeline*. The Acadians were distributed among the English colonies. One party made its way to Bayou Teche, Louisiana, where Cable has described their modern life. After the peace of 1763, about 800 returned to New Brunswick, where the name Acadien is still current. *See* G. P. Bible, *An Historical sketch of the Acadians* (1892); A. Doughty, *The Canadian Exiles* (1914).

**ACAJUTLA,** a Pacific port of El Salvador, Central America, terminus of the British-owned Salvador railroad, and coffee-shipping centre for the republic. The population is (1940) 1,448, and the port an open roadstead, passengers and freight being handled by lighters. The town is 65 mi. distant from San Salvador and 12 mi. from Sonsonate.

**ACANTHACEAE,** a large family of dicotyledonous plants, chiefly tropical and subtropical with bilabiate irregular flowers and for the most part with dehiscent capsules, the seeds borne on characteristic more or less elastic jaculatoria or retinacula, an aid in seed dispersal. In this family, considerable use of pollen grain characters has been made in differentiating genera. The species, all herbs, shrubs or vines, in excess of 2,500, are arranged in about 180 genera. Some of these genera are very large, such as *Justicia,* with in excess of 250 species. Many species are cultivated for ornamental purposes, especially in such genera as *Thunbergia, Graptophyllum, Aphelandra, Barleria, Ruellia, Justicia, Jacobinia, Beloperone, Strobilanthes, Eranthemum, Phlogacanthus,* and others. The leaf characters of certain species of *Acanthus* (*q.v.*) form an important part of the design on the capitals of classical Grecian and Roman columns.

**ACANTHOCEPHALA.** These thorny-headed worms are obligatory parasites, perfectly adapted to parasitic existence, since no stage in the life history possesses any specialized organs for digestion. The mature worms, invariably of separate sexes, live in the intestines of vertebrate hosts, where food is obtained exclusively by absorption through the body wall. While in some species fully mature females are less than 2 mm. (.08 in.) long, in other species they have been reported to exceed 500 mm. (20 in.). Males are usually smaller than females of the same species.

All groups of vertebrates may serve as hosts for Acanthocephala, although for each vertebrate class there are some distinctive genera and species. Introduction into the host intestine is always along with food. So far as known, an arthropod is invariably the first host, although animals which feed upon arthropods may serve as intermediate hosts to carry the worms to the vertebrate.

A typical life cycle is that of *Macracanthorhynchus hirudinaceus* (Pallas, 1781), a species which dwells in the intestine of the hog and undergoes larval development in soil-inhabiting beetle larvae. Developing eggs are given off by the female worm and reach the ground with the intestinal wastes of the pig. In the soil they may be eaten by grubs of the June beetle, cockchafer or other beetle larvae. Within the digestive tract of the grub the egg hatches to a stage called an acanthor. By growth and metamorphosis the acanthella or infective larval stage is reached while still within the body of the grub. The parasite never reaches maturity unless its sheltering beetle larva is devoured by a pig or other suitable host in whose intestine the life cycle is completed.

One of the most distinctive features of all Acanthocephala is the hook-covered proboscis which may be of extremely diverse size and shape. By the use of special muscles this organ is capable of being inverted and withdrawn into a muscular proboscis receptacle within the front end of the body. If in contact with the host intestine when everted, the proboscis hooks tear their way into the intestinal wall to anchor the worm securely.

The wall of the body-proper is composed mainly of a syncytial subcuticula permeated by a series of fluid-filled canals termed the lacunar system. Two continuations of this tissue into the body cavity at its front end constitute organs of problematical function known as the lemnisci. The external surface of the entire body is covered by a cuticula which in many species is adorned with spines.

On its inner surface the subcuticula is lined by two layers of muscle fibres, of which those next to the body cavity are directed longitudinally, the others circularly

A greatly reduced central nervous system or brain is located within the proboscis receptacle, from which a few small nerve fibres pass to surrounding structures. There are no highly specialized sense organs.

Genital organs in both sexes are held in place within a ligament which runs lengthwise through the body cavity. The ovary very early breaks up into a large number of floating egg masses; hence each female is incapable of producing more than one quota of eggs.

Upon fertilization each egg becomes surrounded by a series of protecting membranes and breaks away from the egg mass. Ultimately the developing eggs fill the entire body cavity. The female pore, at or near the posterior extremity, is guarded by a circular muscle, the vaginal sphincter. A short vagina receives the tubular or sac-shaped uterus, which at its forward end bears the uterine bell and the selective apparatus. The funnel-shaped uterine bell opens into the body cavity, which is divided by partitions into a dorsal and a ventral ligament-sac.

When fully mature eggs are passed through the uterine bell into the selective apparatus, they are passed on into the uterus and finally out through the vagina. Eggs not yet ready for elimination are returned to the body cavity by the selective apparatus.

Male organs consist of a pair of testes followed posteriorly by one or a series of cement glands. Accessory male structures include ducts and storage reservoirs for sperm and cement and a complicated eversible bursa, or pouch, for copulation, surrounding the cirrus.

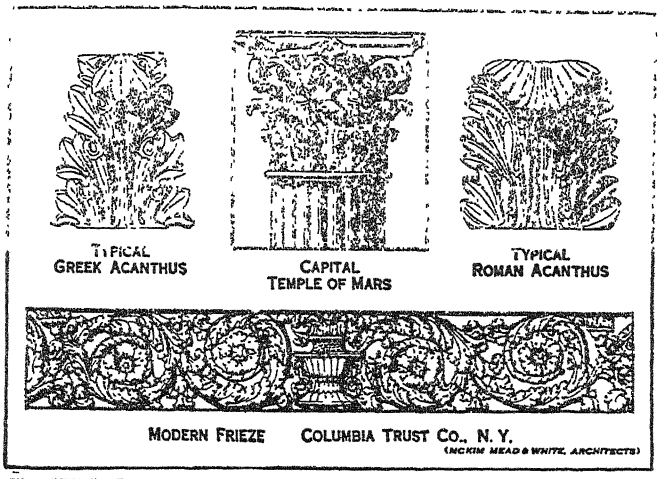
In most species excretory wastes are eliminated through the body surface, although in some of the large forms a pair of branched protonephridial organs are associated with the reproductive organs.

Acanthocephala have been considered by many zoologists as a subdivision of the roundworms. However, in general plan as well as in detail of structure, in their development and in their relationships within the host, they closely parallel the cestodes. Their many distinctive features are best acknowledged by considering them as an independent phylum.

A. Meyer (1932–33) recognized 58 genera with somewhat more than 300 species. Approximately 100 additional species and 20 new genera had been added in the 11 years following the publication of Meyer's monograph.

BIBLIOGRAPHY.—*See* A. Meyer, "Acanthocephala," in Bronn's *Klassen und Ordnungen des Tierreichs* (Leipzig, 1932–33); H. J. Van Cleave, 'Relationships of the Acanthocephala," *Amer. Nat.*, 75(756):31–47 (1941). (H. J. V. C.)

**ACANTHOPTERYGII,** the most specialized section of the bony fishes (Teleostii), characterized by the possession of spines on the first dorsal fin and by the absence usually of a duct connecting the air bladder with the alimentary canal. (*See* FISHES.) They include the perch, the mackerel, the bass (*qq.v.*) and other well-known and important fishes besides numerous less noteworthy forms. In the perches and basses the anterior dorsal fin is armed with formidable spines.



**ACANTHUS,** a genus of plants of the acanthus family (Acanthaceae), embracing some 20 species, mainly perennial herbs and small shrubs, native to the Mediterranean region and the warmer parts of Asia and Africa. They are bold, vigorous, handsome plants, with mostly broad, much divided, often spiny-toothed leaves. The erect stems bear stately spikes of showy white, purple or red flowers, surrounded by sharp-pointed, sometimes highly coloured bracts.

Several species are grown as ornamentals. These are mostly thistle-like plants, with stems 3 ft. to 4 ft. high, the best known of which is the bears' breech or brankursine (*A. mollis*), common in Mediterranean countries, with deeply cut, hairy, shining leaves, which are without spines, and whitish or rose-coloured flowers in spikes 1½ ft. long.

The spiny acanthus (*A. spinosus*), native to southern Europe, is so named because of its very spiny leaves. *A. perringi,* a native of Asiatic Turkey, with red flowers, is suitable for rock gardens. *A. montanus,* native to Greece, with roseate flowers, is grown in greenhouses.

In architectural decoration, the acanthus was first reproduced in metal, and subsequently carved in stone by the Greeks. It was afterwards, with various changes, adopted in all succeeding styles of architecture as a basis of ornamental decoration.

There are two types, that found in the *Acanthus spinosus,* which seems to have been followed by the Greeks, and that in the *Acanthus mollis,* which seems to have been preferred by the Romans.

BY COURTESY OF BUHLMANN, "CLASSIC AND RENAISSANCE ARCHITECTURE" (NEFF AND HELBURN); D'ESPOUY, "FRAGMENTS D'ARCHITECTURE ANTIQUE" (CH. MASSIN ET CIE)

**A CAPPELLA** or **ALLA CAPPELLA,** Italian musical terms meaning literally "as in a chapel or church," whence they have come to be applied to compositions intended to be sung without instrumental accompaniment; or, alternatively, compositions accompanied in a particular way, viz., without the introduction of harmony or parts.

**A CAPRICCIO,** in music a direction signifying that the piece to which it is attached is of a fanciful, capricious nature, and is to be played in like manner.

**ACAPULCO,** a resort city and port of Mexico, at sea level on the Pacific coast in the state of Guerrero, 190 mi. S.S.W. of Mexico City. Pop. (est. 1950) 30,000, plus many transients. Acapulco has the best harbour on the Pacific coast of Mexico, and one of the finest natural anchorages in the world; it is situated on a deep, semicircular bay, nearly landlocked and accessible by land. Acapulco was a main depot for Spanish colonial fleets plying between Mexico, the Philippines and the orient, and continued to be a port of call for steamship lines running between Panamá and San Francisco as well as coastwise trading vessels. The town lies on a narrow strip of land between the bay and steeply rising mountains which encircle it. From May to November the climate is hot and humid, but from December through April it is warm and pleasant; February, March and April are almost rainless. Long a regional economic centre, Acapulco exports hides, cedar and fruit, as well as cotton, tobacco, cacao, sugar cane, Indian corn and coffee grown in the adjacent district of Tabares. No railways connect to Acapulco but a spreading network of highways and frequent air service make it accessible to visitors. Acapulco became "The Riviera of Mexico," deriving much of its livelihood from tourist trade.

A main highway, passing through Taxco and Cuernavaca, runs to Mexico City. (HD. C.)

**ACARNANIA,** a district of ancient Greece, bounded on the west by the Ionian sea, on the north by the Ambracian gulf, on the east and south by Mt. Thyamus and the Achelous. Its most populous region was the plain of the Achelous, commanded by the principal town Stratus; its people long continued in semi-barbarism, communication with the rest of Greece being impeded by mountain ridges and lagoons, but there were a few Corinthian colonies on the coast, founded in the 7th century B.C.; they were ruined in the 5th, through Athenian intervention. In 391 the Acarnanians submitted to Spartan control; in 371, to Theban. In the Hellenistic age they were constantly assailed by their Aetolian neighbours. But they remodelled their ancient cantonal league, apparently after the pattern of Aetolia, and in the 3rd century they formed a close alliance with Philip V. of Macedonia in his Roman wars. For their sympathy with his successor Perseus they were deprived of their federal capital Leucas and required to send hostages to Rome (167 B.C.). The country was desolated by Augustus, who drafted its inhabitants into Nicopolis and Patrae. Acarnania took a prominent part in the national uprising of 1821; it is now joined with Aetolia as a province. Several ancient sites in Acarnania have well-preserved walls, especially Stratus, Oeniadae and Limnaea.

**ACARUS,** a genus of mites (*q.v.*), represented by the human itch-mite, *Acarus scabiei,* causing an irritating skin infection. The disease was known to the ancients, but its cause was discovered only in the 18th century. *See* Reuben Friedman, *Biology of Acarus Scabiei* (1942). (A. PH.)

**ACASTUS,** son of Pelias, but the friend of Jason; he took part in the Calydonian boar-hunt and the Argonautic expedition. After his father's death he instituted splendid funeral games in his honour. His wife Astydameia (called Hippolytē in Horace, *Odes* iii. 7, 17) fell in love with Peleus (*q.v.*), who had taken refuge at Iolcus, and accused him falsely to her husband (*cf.* BELLEROPHON; HIPPOLYTUS). Acastus thereupon left Peleus asleep on Mount Pelion, having first hidden his famous sword. On awaking, Peleus was attacked by the Centaurs, but saved by Cheiron. Having recovered his sword he returned to Iolcus and slew Acastus and Astydameia.

**ACATALEPSY.** In the history of philosophy the Greek term *acatalepsy* was first used by Pyrrho the sceptic to express the view that the human mind has no direct apprehension of material objects. One is consequently not justified in making assertions about what things really *are in themselves.* Each person can only say how things *appear to him.*

**ACAULESCENT,** a term used of a plant apparently stemless, as dandelion, the stem being almost suppressed.

**ACCADIAN,** an adjectival form of the name Accad or Akkad. Sumer and Akkad were the principal sub-regions of Babylonia (*q.v.*) and in view of the dialectical and ethnological differences between the peoples of the two regions, the terms Sumerian and Accadian came to represent the languages and ethnic groups of the two regions. (*See* SUMERIAN LANGUAGE.)

**ACCA LARENTIA,** in Roman legend, the wife of the shepherd Faustulus, who saved the lives of Romulus and Remus. Attempts have been made to explain the wolf legend by suggesting that Larentia was called *lupa* ("courtesan," literally "she-wolf") because of her immoral character (Livy i, 4; Ovid, *Fasti,* iii, 55). According to another account, Larentia was a beautiful girl whom Hercules won at dice (Macrobius i, 10; Plutarch, *Romulus,* 4, 5, *Quaest. Rom.,* 35; Aulus Gellius vi, 7). By his advice she married a wealthy Etruscan named Tarutius. She inherited his property and bequeathed it to the Roman people, who instituted in her honour a yearly festival called Larentalia (Dec. 23) According to some, Acca Larentia was the mother of the Lares and symbolized the fertility of the earth, in particular the city lands and their crops.

*See* Mommsen, "Die echte und die falsche Larentia," in *Romische Forschungen* ii (1879); E Pais, *Ancient Legends of Roman History* [illegible] D. Rouse, *The Year's Work in Classical Studies* (1907).

**ACCELERANDO** (Ital ), in music a direction signifying that the *tempo,* or speed of performance, is to be quickened.

**ACCELERATION,** as used in mechanics, a term denoting the rate of change in the velocity of a moving body. It is what the increment in velocity in a unit of time would be if the rate of change were uniform for that unit When a body falls in a vacuum near the earth's surface, the increment in velocity is about 32.16 ft. per second, and this is known as the acceleration of gravity. In astronomy the term has other uses, as when it refers to the time which the stars gain upon the sun in passing the meridian each day. (*See* MECHANICS; DIMENSIONAL ANALYSIS; GRAVITATION.)

**ACCELERATOR,** in a motor car (*q.v.*) the pedal which operates the throttle and thus controls the engine speed.

**ACCELEROMETER,** in aeroplane flight testing an instrument used to measure the acceleration of an aircraft in a defined direction The most common models consist substantially of a weight supported on a diaphragm or from a cantilever spring. By recording the movements of this weight during various manoeuvres of the aeroplane the accelerations undergone by the plane itself can be computed. With the accelerations known, designers can further compute the loads placed upon the structure of the aeroplane by manoeuvres, such as spins, loops and sharp pull-outs from dives, and adjust their structural strength factors accordingly. (*See* AEROPLANE.) (D. SE.)

**ACCENT,** a term used by the earlier Greek grammarians for the musical accent which characterized their own language, but later the term became specialized for quantity in metre, whence comes the Eng *prosody* (Lat. *accentus,* a literal translation of Gr προσῳδία) In all languages there are two kinds of accent: (1) musical chromatic or pitch accent; (2) emphatic or stress accent. The former indicates differences in musical pitch between one sound and another in speech, the latter the difference between one syllable and another which is occasioned by emitting the breath in the production of one syllable with greater energy than is employed for the other syllables of the same word. These two senses are different from the common usage of the word in the statement that someone talks with a foreign or with a vulgar accent.

In different languages the relations between pitch and stress differ greatly. The pitch accent is well marked, for example, in Lithuanian and Swedish. Modern Greek has changed from pitch to stress, the stress being generally laid upon the same syllable in modern as bore the pitch accent in ancient Greek. In the majority of European languages, however, stress is more conspicuous than pitch. To the existence of stress in the original language from which Greek, Latin, Celtic, Teutonic, Slavonic and other languages of Europe are descended, must be attributed a large part of the phenomena known as ablaut or gradation. In modern languages we get *Acton* out of the O.E. *āc-tūn* (oak-town), and more recently the contrast between *New Town* and *Newton.* The strong stress accent existing in the transition period between Latin and French led to the curtailing of long Latin words like *latrocinium* or *hospitāle* into the words which we have borrowed from French into English as *larceny* and *hotel.*

In both pitch and stress accent different gradations may be observed. In pitch, the accent may be uniform, rising or falling Or there may be combinations of rising and falling or of falling and rising accents upon the same syllable In ancient Greek there were (1) the acute (´), a rising accent; (2) the grave (`), apparently merely the indication that in particular positions in the sentence the acute accent is not used where it would occur in the isolated word, and (3) the circumflex, which as its form (^) shows, and as ancient grammarians state, combines the rising and the falling accent upon the same syllable, this syllable being always long. Different Greek dialects varied the syllables of the word; in historical times the accent had become limited to the last three syllables of a word. The theory that, as every vowel has its own natural pitch, and a frequent interchange between *e* (a high vowel) and *o* (a low vowel) occurs in the Indo-European languages, *e* originally went with the highest pitch accent, while *o* appeared in syllables of a lower pitch, has no certain foundation since there are many exceptions. Somewhat similar distinctions characterize stressed syllables. According as the strength of the expiration is greatest either at the beginning, the end or the middle of the syllable, the accent is a falling, a rising or a rising and falling one Syllables in which the stress is produced continuously whether increasing or decreasing are called single pointed, those in which a variation in the stress occurs without being strong enough to break the syllable into two are called double pointed There is no separate notation for stress accent, but the acute (´) is used for the increasing, the grave (`) for the decreasing stress. the circumflex (^) for the rising and falling (increasing and decreasing) and (˘) for the opposite. A separate notation is needed.

The relation between the two accents in the same language at the same time is a subject which requires further investigation In prehistoric times the stress in Latin must have rested upon the first syllable in all cases Only on this hypothesis can be explained forms like *peperci* (perfect of *parco*) and *collido* (a compound of *laedo*), for throughout the historical period the stress rested in these words upon the second syllable from the end.

Besides the accent of the syllable and of the word, there remains a more complicated problem, the accent of the sentence From earliest times some words have become parasitic or enclitic upon other words. Pronouns more than most words are modified from this cause, but conjunctions like the Gr τε ("and"), the Lat. *que,* have throughout their whole history been enclitic upon the preceding word. An important word may be enclitic, as in English *don't, shan't.*

**ACCEPTANCE,** generally, a receiving or acknowledgment of receipt; in law, the act by which a person binds himself to comply with the request contained in a bill of exchange (*q.v.*), addressed to him by the drawer. Acceptance may be either general or qualified A general acceptance is an engagement to pay the bill strictly according to its tenor and is made by the drawee subscribing his name, with or without the word "accepted," at the bottom of the bill, or across the face of it Qualified acceptance may be a promise to pay on a contingency occurring, *e.g.,* on the sale of certain goods consigned by the drawer to the acceptor. No contingency is allowed to be mentioned in the body of the bill on pain of rendering the bill non-negotiable. But a qualified acceptance is quite legal and equally binding with a general acceptance upon the acceptor when the contingency has occurred. It is also a qualified acceptance where the promise is to pay only part of the sum mentioned

in the bill, or to pay at a different time or place from those specified. As a qualified acceptance is so far a disregard of the drawer's order, the holder is not obliged to take it; and if he chooses to take it he must give notice to antecedent parties, acting at his own risk if they dissent. A bill can be accepted in the first instance only by the person or persons to whom it is addressed; but if he or they fail to do so, it may, after being protested for non-acceptance, be accepted by some one else "*supra* protest," for the sake of the honour of one or more of the parties concerned in it, and he thereupon acquires a claim against the drawer and all those to whom he could have resorted.

For *acceptance of an offer, see* CONTRACT.

Acceptance has a further technical meaning in law in the case of delivery of goods pursuant to a prior contract for sale. Either an expression by the buyer of his assent to become owner, or his doing of some act inconsistent with the seller's ownership—such as selling or using part of the goods, will constitute such an acceptance. The effect is, in English law, to make impossible the later rejection of the goods, and leave the buyer a remedy in damages for any non-compliance of the goods with the contract. In some American States the acceptance, at least if not accompanied by an express claim of non-compliance, will wholly bar the buyer from any later claim that the goods were not up to contract. Under the prevailing American doctrine laid down in the Uniform Sales Act, however, the buyer can at his option if the goods accepted do not comply, either have damages, or return the goods and forego damages. If the contract is oral and no part payment has been made, both delivery and acceptance of some portion of the goods are necessary to make the contract enforceable at all. (X.)

**United States.**—In the United States trade acceptances are rediscountable at the Federal Reserve Bank if the date of maturity be not more than 90 days from the date offered for discount, except in the case of agricultural paper, for which the limit is 180 days. The Federal Reserve Bank shall take such steps as it deems necessary to satisfy itself as to the eligibility of any trade acceptance offered for rediscount and may require a recent financial statement of one or more of the parties to the instrument. To satisfy itself that the acceptance meets the primary requirement of arising out of a current merchandise transaction, the Federal Reserve Bank rules that "it must bear on its face or be accompanied by evidence satisfactory to the Federal Reserve Bank that it was drawn by the seller of the goods on the purchaser of such goods." Such evidence may consist of a certificate on or accompanying the acceptance to the following effect: *The obligation of the acceptor of this bill arises out of the purchase of goods from the drawer.* Such certificate may be accepted by the Federal Reserve Bank as sufficient evidence, provided, however, that the Federal Reserve Bank, in its discretion, may inquire into the exact nature of the transaction underlying the acceptance.

By the use of the trade acceptance, the seller of goods instead of having merely an open book account on a credit transaction, procures a negotiable evidence of the debt. The actual conversion of the original draft into a trade acceptance is accomplished when the buyer (drawee) writes across its face the word "accepted," together with the date and the place of payment, either at a banking house or at the place of business of the seller (drawer), and affixes his signature. Upon receipt of the accepted draft, the seller of goods (drawer) may either hold it to maturity and then collect, or discount it to procure immediate funds.

Authoritative information on current usage in connection with trade acceptances is published from time to time in the *Federal Reserve Bulletin* under "Rulings of the Federal Reserve Board" and "Opinions of Counsel of the Federal Reserve Board." (J. H. B.)

**ACCEPTILATION,** in Roman and Scots law, a verbal release of a verbal obligation. This formal mode of extinguishing an obligation contracted verbally received its name from the book-keeping term *acceptilatio*, entering a receipt, *i.e.*, carrying it to credit. The words conveying the release had to correspond to, or strictly cover, the expressed obligation.

**ACCESS,** approach, or the means of approaching. In law, the word is used in various connections. The presumption of a child's legitimacy is negatived if it be proved that a husband has not had access to his wife within such a period of time as would admit of his being the father. (*See* LEGITIMACY.)

In the law of easements (*see* EASEMENT), every person who has land adjoining a public road or a public navigable river has a right of access to it from his land. So, also, every person has a right of access to air and light through an ancient window. For the right of access of parents to children under the guardianship of the court, *see* INFANT.

**ACCESSION,** in law, a method of acquiring property adopted from Roman law, by which, in things that have a close connection with or dependence on one another, the property in the principal draws after it the property in the accessory, according to the principle, *accessio cedet principali.* Accession may take place either in a natural way, such as the growth of fruit or the birth of animals, or in an artificial way. The various methods may be classified as (1) land to land by accretion or alluvion (*q.v.*), (2) movables to land (*see* FIXTURES); (3) movables to movables; (4) movables added to by the art or industry of man; this may be by specification, as when wine is made out of grapes, or by confusion, or commixture, which is the mixing together of liquids or solids, respectively. In the case of industrial accession ownership is determined according as the natural or manufactured substance is of the more importance, and, in general, compensation is payable to the person who has been dispossessed of his property.

In a historical or constitutional sense, the term "accession" is applied to the coming to the throne of a dynasty or line of sovereigns or of a single sovereign. "Accession" sometimes likewise signifies consent or acquiescence. Thus, in the bankruptcy law of Scotland, where there is a settlement by a trust-deed, it is accepted on the part of each creditor by a "deed of accession."

**ACCESSORY,** a person concerned in the commission of a felonious offence, not as principal, but by participation; as by advice, command, aid or concealment. In certain crimes there can be no accessories, all concerned being principals, whether present or absent at the time of their commission. There is no accessory to misdemeanour.

There are two kinds of accessories—*before* the fact and *after* it. The first is he who commands or procures another to commit felony and is not present himself; for if he be present he is an abettor (*q.v.*). The second is he who, knowing a man has committed a felony, receives, harbours or assists him. An accessory before the fact is liable to the same punishment as the principal; and there is now indeed no practical difference between such an accessory and a principal in regard either to indictment, trial or punishment. Accessories after the fact are in general punishable with imprisonment (with or without hard labour) for a period not exceeding two years. (*See* the Accessories and Abettors Act 1861.)

**ACCIACCATURA,** in music, an old type of ornament in pianoforte and organ playing which consisted in reinforcing a particular note by striking simultaneously with it the note below it, the latter being then immediately released. (From Ital. *acciaccature*, to crush.) Nowadays it is more often applied to the shorter kind of *appoggiatura* (*q.v.*).

**ACCIAJUOLI, DONATO** (1428–1478), Italian scholar, was born at Florence and became gonfalonier of the city in 1473. His works are: a Latin translation of some of Plutarch's *Lives* (Florence, 1478); Commentaries on Aristotle's *Ethics* and *Politics;* and lives of Hannibal, Scipio and Charlemagne. In the work on Aristotle he had the co-operation of his master Argyropulos.

**ACCIDENCE,** the term for the grammatical changes to which words are subject in their inflections as to gender, number, tense and case (a mis-spelling of "accidents," from the Latin neuter plural *accidentia,* casual events). Also used for a book containing the rudiments of grammar, and so of any subject of art.

**ACCIDENT.** This term has a perplexing variety of meanings, which are, however, not entirely disconnected when considered historically. The meaning of the term varies with the antithesis intended. To this, accordingly, attention must be paid

in any context in which "accident" occurs. The following account deals with the principal antitheses and attempts to indicate the way in which the term "accident" acquired its various meanings.

(1) *Accident and Substance.*—Perhaps the oldest use of the term "accident" was by way of contrast with the term "substance" or "thing." "Substance" means the basic reality which has various qualities, stands in various relations, etc. These qualities, relations, etc., on the other hand, need a basis or support to qualify—they are "accidents," accessions to something that is there to bear them (substance). Among the schoolmen, accordingly, almost any quality was commonly called an accident; and this usage was fairly common even in the 17th century—"accident" and "substance" corresponding roughly to "quality" and "thing" respectively, as these terms are commonly used.

(2) *Accident and the Self-existing.*—In the strict sense of the term, as distinguished from its more usual meaning even among philosophers, the term "substance" means that which exists in itself and through itself, and when so interpreted its familiar contrast with "accident" naturally prompts the application of the term "accident" to *anything* that is dependent on some other thing. In this case, even what are commonly called "things" or "substances" will be classed among "accidents" Thus for Spinozism there is only one Substance, namely God, who alone is self-existing, while all finite things and even the so-called "infinite modes" (such as motion) are really "accidents," or dependent existents. Cartesianism, too, made this admission, or one very like it to all intents and purposes, but allowed the name "substance," in a qualified sense (that is, in the popular sense) to finite bodies and to souls.

(3) *Real Accidents.*—The antithesis between "accident" and "substance" just explained (2), clearly cuts across the distinction between "quality" and "thing," with which, according to one usage, it coincided more or less (1). Now, some of the schoolmen maintained that there are certain sense-qualities of things which are not dependent on the substances with which they are sometimes combined, but can exist by themselves, apart from such substances. These alleged independent or self-existing qualities they called "real accidents."

(4) *Accident and Essence.*—The distinctions between "substance" and "accident" explained in (1) and (2) naturally led people to regard an "accident" as something less important than substance, as something not *essential* to substance; and so the term "accident" was contrasted with whatever is not really essential to anything. Thus in logic, for instance, the so-called *fallacy of accident* is the erroneous assumption that a claim to know anything or anybody implies a knowledge even of all that is non-essential in relation to it or him. Similarly, in the doctrine of the Predicables (*q.v.*), as commonly expounded in books on logic, the predicable "accident" is contrasted with the other four predicables in the sense that any predicate asserted of a subject but not essential to it is called an "accident" of it, whereas any predicate essential to the subject of which it is affirmed belongs to one or other of the remaining predicables.

(5) *Accident, Necessity and Design.*—The kinship between what is "essential" and what is "necessary" has prompted the common use of "accident" for what is otherwise called a "chance" occurrence. And by a somewhat similar extension of its meaning the term "accident" has come to be applied in law to any occurrence or result that could not have been foreseen by the agent (because not necessarily involved in his action), or to a result not designed (and, therefore, presumably not foreseen), and lastly, to anything unexpected.

(6) *"Essential" and "Accidental" Accidents.*—One curious consequence of the multiplicity of meanings of "accident" is that by using the noun in the sense explained in (1) and the adjective in the sense explained in (4) the schoolmen distinguished between "essential" accidents and "accidental" accidents (*i.e.*, qualities).

**ACCIDENTALISM,** a term used (1) in philosophy for any system of thought which denies the causal nexus and maintains that events succeed one another haphazard or by chance (not in the mathematical but in the popular sense). In metaphysics, accidentalism denies the principle of universal causation, that is, the doctrine that everything occurs or results from a definite cause. In this connection it is synonymous with Tychism, a term used by C. S. Peirce for the theories (like that of Plato, *e.g.*) which make chance an objective factor in the process of the universe. Opponents of this accidentalism maintain that what seems to be the result of chance is in reality due to a cause or causes which, owing to the lack of imagination, knowledge or scientific instruments, we are unable to detect. In ethics the term is used, like indeterminism, to denote the theory that mental change cannot always be ascribed to previously ascertained psychical states, and that volition is not causally related to the motives involved An example of this theory is the doctrine of the *liberum arbitrium indifferentiae* (liberty of indifference), according to which the choice of two or more possibilities is affected neither by contemporaneous data of an ethical or prudential kind nor by crystallized habit (character). (2) In painting, the term is used for the effect produced by accidental lights (Ruskin, *Modern Painters,* I. ii. 4, iii., §4, 287). (3) In medicine, it stands for the hypothesis that disease is only an accidental modification of the healthy condition, and can, therefore, be avoided by modifying external conditions.

**ACCIDENTALS,** in music, are signs signifying that the notes to which they are attached have to be raised, lowered, or restored to their original pitch as the case may be. Thus a sharp (♯) raises a note a semi-tone, a flat (♭) lowers it a semi-tone, while a natural (♮) restores it once again to its former status. Each sign may also be doubled, though in the case of the double sharp, signifying the raising of the note by two semi-tones, the sign × is used instead of ♯♯; ♭♭, indicating a double flat, signifying the lowering of the note by two semi-tones; and ♮♮ serving to correct or cancel a preceding double-sharp or double-flat, although in modern practice a single natural (♮) is usually considered sufficient for this purpose. Accidentals introduced in the course of a piece apply only during the bar in which they occur, whereas when placed at the beginning of a composition, and constituting thereby what is called its signature, they govern the notes affected throughout the whole of the piece: but in the latter case they are not properly called accidentals. For explanation of origin and application of signs used for accidentals, *see* MUSICAL NOTATION.

**ACCIDENT INSURANCE, PERSONAL.** In England this type of insurance owed its origin to the risks of accident associated with early railway travel and even in the mid-20th century railway travel policies were common. Until 1908, when the Fatal Accidents (Damages) act was passed, payments under accident policies were generally applied to the reduction of damages payable to the injured person by a negligent third party After that time, personal accident insurances became increasingly popular, especially among salaried and professional men outside the benefits of Workmen's Compensation legislation.

**Accidents-only Policies.**—The commonest form of policy covers accidents only. The occupation and pastimes of the proposer are indicative of the hazard. Sedentary occupations are rated lowest while rates are graded up to those engaged in manual work, with the highest rates for work in connection with woodworking machinery and other work of unusual risk.

The accident-only policy provides for payment of benefits specified following "accidental bodily injury caused solely and directly by violent external and visible means." These words are used in their ordinary meaning, and when it has been necessary to refer cases to the courts it has always been shown that, provided the occurrence causing the accident has been something which was neither expected nor designed, then the expression "accidental" has been fulfilled. There must, however, be some sign of violence and there must also be a visible effect produced upon the person concerned. The benefits provided by such a policy are in the event of:—

| | |
|---|---|
| (1) Death | The capital sum. |
| (2) Total loss by actual physical separation at or above the ankle or wrist of two limbs, or the loss of sight of both eyes, or the loss of one limb and the loss of sight of one eye | The capital sum |
| (3) Total loss as in (2) of one limb or the sight of one eye | One-half of the capital sum. |

The above misfortunes must occur within three calendar months of the happening of the accident.

(4) Temporary total disablement from engaging in or giving attention to the insured's occupation Corresponding weekly benefit.
(5) Temporary partial disablement in similar circumstances. . . . One-third or one-quarter of benefit under (4).

The liability for the weekly payments is limited to 26 or 52 weeks, as the case may be, in respect of any one year of insurance. When one of the capital sums is payable no claim can be made for weekly compensation and if a payment has already been made for weekly compensation which is followed by a misfortune warranting a capital payment the total liability of the insurers cannot exceed the latter sum

**Accidents and Specified Diseases Policies.**—Such policies are similar to accidents-only policies but provide weekly benefits in addition for certain specified diseases Double benefits are provided if the insured person is killed or injured in an accident to a passenger lift, train, tramcar, omnibus or other licensed vehicle plying in the streets for public hire in which he is travelling as a passenger. An annuity is payable so long as the disability continues if the injury, while not entitling the payment of a capital sum, results in total disablement for not less than 12 months, or should the insured person lose completely the sight of both eyes by disease, or should he contract paralysis in at least two limbs, provided that this condition has existed for at least six months. Such policies are world-wide as regards accident cover, but cover for disease is restricted to civilized regions.

Cumulative bonus additions to the capital sums insured and discounts from premiums for life policyholders and to total abstainers are common features.

Provision can be made for the payment of medical expenses in connection with injuries or illness within the scope of the policy subject to a stated limit.

**Accidents and All Sickness Policies.**—Such policies are similar to those previously described, but in addition weekly payments are made to the insured if, as a result of any illness necessitating treatment by a qualified medical practitioner giving a certificate specifying the disease, he is confined to the house for not less than seven days and is totally disabled and prevented from attending to any part of his business. The period during which compensation may be payable varies between 26 and 104 weeks, though most insurers limit their liability to 52 weeks. Temporary partial disablement benefits are provided while the insured is convalescent, but the weekly payments are reduced to one-quarter of those payable for total incapacity by illness and the period is usually limited to four weeks. Such policies are terminated when the insured reaches the age of 60 and no payment is made for any illness contracted within four weeks after the commencement of the insurance. The illness risk is limited to the country in which the policy is issued, subject to the consent of the insurers should the insured propose to travel. A few insurers issue noncancellable accidents and illnesses policies. Such insurances are uncommon, but provided that the renewal premiums are paid the policy continues till the age of 55, when the insurance terminates. Premiums are calculated on an actuarial basis.

**General Policy Conditions.**—In the event of an accident the insured must, within 21 days, notify the insurers and send full particulars, accompanied by satisfactory medical evidence. The insured must, if required by the insurers, submit to a medical examination by the insurers' doctor and in the event of death the insurers are entitled to order a post-mortem examination at their own expense. If the insured changes his occupation he must notify the insurers and he must also advise them should he suffer any disease, physical defect or infirmity, thus giving the insurers an opportunity of reconsidering the risk. A cancellation clause is provided and the insurers may, by giving seven days' written notice to the insured, terminate their liability without prejudice to any claim which may arise prior to the termination of such notice. All differences arising out of the contract must be referred to arbitration.

**Sickness Indemnities.**—The benefits under such policies are similar to those provided by the accidents-only policy and in addition a weekly indemnity is provided for periods of continuous disability not exceeding 52 consecutive weeks If as the result of a disease or illness the insured loses the use of two limbs or the sight of both eyes the insurers will pay him, in lieu of any other indemnity, excepting surgical or hospital fees, the weekly indemnity specified in the policy during the period in which the insured is disabled up to a maximum of 100 weeks No payment is made for any disease for which the insured is not treated by a physician nor for any disease in respect of which disability commences while the policy is not in force

**Coupon Insurance.**—Before World War II there was a considerable growth in this class of business, which is generally undertaken by insurance companies on behalf of the periodicals concerned. The benefits, unlike those of the ordinary personal accident policies issued by insurance companies, apply only to more uncommon accidents and the weekly payments are generally very limited. Their most striking feature is the enormous capital sums which are offered as an inducement to buy the newspaper or magazine concerned.

**Group Personal Accident Schemes.**—Many commercial undertakings effect group policies to provide benefits for the whole of their employees falling within certain categories—generally the more highly paid staff who are not within the scope of the Workmen's Compensation acts. Such policies may be restricted to occupational accidents or may in some cases apply to any accident to any person within the scheme. The benefits provided are usually in a direct relationship to the earnings of the insured person and might take the following or similar form:

| | |
|---|---|
| (1) Death . . . . . | Two years' salary |
| (2) Permanent total disablement . | Two years' salary |
| (3) Permanent partial disablement | One year's salary |
| (4) Permanent total disablement . | First 13 weeks—full salary<br>Next 13 weeks—½ salary<br>Next 13 weeks—¼ salary<br>Next 13 weeks—¼ salary |

Compensation is not usually payable for more than 52 weeks in all and is not payable until the end of the disability.

It is unusual to require individual proposal forms from the respective employees to be included but the employer would be required to declare any disabilities or infirmities suffered, to his knowledge, by any person to be included. Premiums are calculated at a rate per cent based upon the estimated salaries of the grades of staff to be included subject to adjustment at the end of each period of insurance on the salaries actually paid.

**Aviation Risks.**—Most policies issued in Great Britain ordinarily exclude liability for accidents happening while the policyholder is "in on or about to enter or alighting from any vessel or machine made or intended for ascending in the air." Policies are freely extended, for additional premium, to cover flying risks while the policyholder is travelling as a fare-paying passenger. Some insurers issue policies to flying services personnel to cover them while they are flying other than operationally. Such policies generally exclude war risks. The commonest form of aviation personal accident insurance is by "coupon" taken out when booking a passage. Premium rates for travel by first-class air lines are very low indeed but higher rates are required for travel by others with less satisfactory facilities.

**War Risks.**—Practically all policies exclude the risk of death or injury due to war. War risks are, however, insured in connection with air travel at rates varying with the war hazards in the areas to be traversed. In wartime the unexplained disappearance of an aircraft may well be due to war, but in the absence of proof the claim will be met under the policy. In wartime, therefore, the premium for flying risks tends to rise and the premium for war risks may be relatively small. (A. G. M. B.)

## UNITED STATES PRACTICE

With regard to accident and health insurance in the United States, American practice differs in various details from that of Great Britain, though the general principles are the same. In America, the *proposer* is called the *applicant* and the *proposal* becomes the *application,* while the *capital sum* is styled *principal sum.* The word "indemnity" as used in American policies is

synonymous with "benefit," the amounts provided in the policies being classed as fixed or premeasured indemnity, regulated in amount by the ability or willingness of the insured to pay, and the policy becomes a valued benefit contract; there is no provision by which the amounts payable may be reduced in case of disability even though benefits payable under all insurance carried exceed the insured's earnings, but underwriters exercise great care against overinsurance in the original issue, requiring each applicant to certify that his earnings are in excess of benefits payable under all insurance carried and usually limiting the amount of insurance permitted to approximately three-fourths of the earnings.

There is never any right of subrogation in American policies by which the insured surrenders any claims against a third party who may be responsible for his injury. American policies do not carry a condition prohibiting the obtaining of additional insurance without consent of the company, but some contain a condition to the effect that if other insurance is obtained without notice to the company the amount of existing insurance is proportionately reduced. A great variety of accident policies, and a se of accident and health policies, is issued in America, with many variations in amounts payable and in the sundry features. With a fixed principal sum payable for accidental death and a fixed weekly benefit payable for disability, there may be variations in the percentage of principal sum payable for loss of eyesight, or for loss of one or more limbs, or even for the degree of loss of a particular limb. Likewise, many variations occur in the period for which disability benefit is payable. It may be limited to a specified number of weeks, varying from a few to many, or the period for which benefit is payable may be limited only by the period of disability. Under the most common practice no period limit is fixed in case of disability from accident, while a limit of fifty-two weeks in case of disability from sickness is most favoured.

Partial disability is usually provided for at the rate of 40% of the total disability rate in respect to disability caused by accidental injury, but is not generally provided for in case of sickness disability, though in some instances a certain provision may be made for partial disability, or disability not requiring confinement to the house may be classified as partial and a smaller benefit provided. The usual American accident policy provides specific sums for loss of life, limb or sight and a stated weekly benefit for disability, while the usual health policy, commonly combined with the accident policy into a single document, provides a stated weekly benefit for disability due to sickness with occasional additional payments in case of complete blindness or complete paralysis. Most accident policies contain a provision doubling the benefits payable in case of accidents occurring in public passenger conveyances, elevators or burning buildings, and some include in this class other hazards more or less incident to the risk of travel.

Other provisions common in American policies include additional payments against surgical operations, hospital treatment, nursing and payment of doctors' bills in the case of non-disabling injuries. Some include an optional clause under which in case of certain specified injuries, such as fractures and dislocations, the insured may elect to take a lump sum in lieu of the disability benefit. There is no real uniformity as respects the inclusion of these subordinate features. Some accident policies are of more restricted scope and may exclude from their coverage a certain class of accidents, specified in greater or less number, in which case proportionately less premium is charged. There is also a great variety of special or "limited" policies designed to insure only against a certain class or a small number of classes of accidents. These are often referred to as "coupon" insurance because generally sold by special advertising or offered as an inducement to purchase of goods, subscription to a newspaper or other periodical. Generally they apply to accidents of least common occurrence and because of that fact a merely nominal price is charged, and are issued upon receipt of coupons attached to the advertisement.

The insuring clause most commonly in use in America differs somewhat in wording from that in use in Great Britain. Usually it defines the insurance to be "against bodily injuries caused directly and independently of all other causes by accidental means," or by violent and accidental means, or by external, violent and accidental means, and there are other variations of verbiage without significant change of substance, the purpose always being to insure against the physical results of injury to the body caused wholly by accident, as distinguished from the natural processes following either wholly or partly from disease, degeneration or disintegration, which latter in case of disability becomes the function of health insurance and in case of death becomes the function of life insurance.

**Health Insurance.**—The most favoured form of health insurance in America insures against all sicknesses from whatever cause, and in such policies there are numerous variations. They may provide for all disability from the first day thereof to a specified period or without limitation. They may exclude from benefit the initial period of any disability and cover only disability after one week, or after a number of weeks or a number of months, with premiums varying in proportion. They may restrict payment of benefit to the period of confinement to house or may be without this restriction. They may exclude sickness contracted within a certain short period after the date of the policy or may cover any sickness contracted after the policy date. Additional payments may cover surgical operations, hospital treatment and nursing charges, or any or all of these may be omitted. Usually health policies stipulate that the insured must be under the treatment of a physician during any period for which disability may be claimed in order that there may be competent certification and that the necessary disability may be delimited as far as possible by proper care and treatment. So-called "limited" health policies are also issued to some extent, which confine their coverage to disability from certain diseases specifically named. Untold variations in this respect may be devised with proportionate variations in premium.

**Statutory Provisions.**—Those provisions of accident and health policies that relate to the performance and operation of the contract after issue are generally regulated by law. Many states have enacted statutes prescribing certain "standard provisions" which must be included in all such policies and prohibiting the inclusion of any contradictory or inconsistent conditions. Even in the states where such statutes have not been enacted it is the common practice of the companies to issue the same policies uniformly in all of them. These provisions govern such matters as the pro-rata reduction of the insurance in case of a change of occupation to one more hazardous, alterations or assignments of policies, reinstatement after lapse, the timely giving of notice and filing of proof of claim, examination by the company's physician in connection with claims, time for payment after proof, right of cancellation by insured in case of change of occupation to one less hazardous, rights of beneficiary, time when legal proceedings may be instituted. Certain other provisions may be included or omitted at the option of the issuing company. These permit reservation by the company of a right to cancel or to refuse to renew the policy, reduction of the amount of insurance in case additional insurance is obtained without notice, deduction from any benefit payable of premium then due and unpaid, limitation of the amount of insurance one person may have under various policies in the same company, limitation of the coverage within certain minimum and maximum age limits.

American policies do not require notice by the insured of a change of occupation, but the effect of such change, if any, is regulated by the statutory provisions. No notice is required from the insured of any change in his state of health except when it is to be made the basis of a claim for benefit. No arbitration clause is included in American policies, such a provision being commonly held illegal as tending to oust the courts of their jurisdiction.

**Physical Condition of Applicant.**—In the underwriting of both accident and health insurance the general physical condition of the applicant is given much weight, the application requiring disclosure of his present physical condition and past health record, which may influence the action of the underwriter even in the

issue of accident insurance where the state of health suggests susceptibility to more serious results in case of accident than would be common with a normal person, while both physical condition and health record are even more carefully considered when the application is for health insurance because of the possibly greater susceptibility to disease or sickness.

**Premium Rates.**—The premium rates for accident insurance are governed wholly by occupation, a basic rate first being fixed to cover the general hazards of life outside of the occupation and this rate being increased in proportion to additional hazards involved by the occupational exposure. For this purpose all known occupations are classified by the companies and they are brought into groups of relatively equal risk, resulting in some eight or more different rate classes as indicated by developed experience. Rates for health insurance do not commonly vary according to occupation, though benefit provisions often vary for the purpose of adjusting the cost in such occupations as involve particular exposure to occupational disease.

**Canadian Practice.**—In the dominion of Canada general practices and forms of policies are very similar to those of the United States and statutory standard provisions also are required, these being similar to those in use in the United States.

**ACCIDENTS, INDUSTRIAL:** *see* Industrial Accidents.

**ACCIUS** or Attius, **LUCIUS,** Roman tragic poet, the son of a freedman, was born at Pisaurum in Umbria, in 170 B.C. He must have lived to a great age, since Cicero (*Brutus,* 28) speaks of having conversed with him. His plays, which are praised by ancient writers (Horace, *Epistles,* ii, 1, 56; Cicero, *Pro Plancio,* 24), were mostly free translations from the Greek, but a few (including *Brutus* and *Decius*) were on Roman subjects. About 700 lines are extant and are given in Ribbeck (*Tragic Lat. Relig.*).

Accius wrote other works of a literary character: *Didascalicōn* and *Pragmaticōn libri,* treatises in verse on the history of Greek and Roman poetry and dramatic art in particular; *Parerga* and *Praxidica* (perhaps identical) on agriculture; and an *Annales.* He also introduced innovations in orthography and grammar.

*See* M. Boissier, *Le Poète Accius* (1856); L. Müller, *De Accii fabulis Disputatio* (1890); O. Ribbeck, *Geschichte der römischen Dichtung* (1892); editions of the tragic fragments by Ribbeck (1897), of the others by Bährens (1886); F. Plessis, *Poèsie latine* (1909).

**ACCLAMATION,** in deliberative or electoral assemblies, a spontaneous shout of approval or praise (Lat. *acclamatio*), the adoption of a resolution or the passing of a vote of confidence or choice unanimously, in distinction from a ballot or division. In the Roman senate votes were passed by acclamation in such forms as *Omnes, omnes, Aequum est, Iustum est,* etc.; and the praises of the emperor were celebrated in prearranged sentences by the whole body of senators. In ecclesiastical councils vote by acclamation is common, the question being put in the form, *placet* or *non placet.* The Sacred college has elected popes by acclamation, when the cardinals simultaneously "acclaimed" one of their number as pontiff. In modern parliamentary usage a motion is carried by acclamation when approval is expressed by shouting such words as *Aye* or *Agreed.*

**ACCLIMATIZATION.** As in the case of so many words used by the biologist and physiologist, the word acclimatization is hard to define. With increase in knowledge and understanding, meanings of words change. Originally, the term acclimatization was taken to mean only the ability of human beings or animals or plants to accustom themselves to new and strange climatic conditions. A man or a wolf moves to a hot climate and is uncomfortable there; but after a time, he is better able to withstand the heat. But aside from temperature, there are other aspects of climate. A man or an animal may become adjusted to living at higher altitudes than those he was originally accustomed to. At ordinary mountain altitudes, this does not involve much of an adjustment to change in atmospheric pressure, for mountain climbers suffer more from lack of oxygen than from change in pressure. At really high altitudes, such as aviators may be exposed to, however, the low atmospheric pressure becomes a factor of primary importance. In changing to a new environment, a man may, therefore, meet new conditions of temperature or pressure, and in addition he may have to contend with different chemical surroundings. On high mountains, the amount of oxygen in the atmosphere may be relatively small; in crowded cities, he may become exposed to relatively high concentrations of carbon dioxide or even carbon monoxide; and in various areas, he may be exposed to conditions in which the water content of the atmosphere is extremely high or extremely low. Thus in the case of higher animals and man, the concept of acclimatization includes the phenomena of increased toleration of high or low temperature, of altered pressure, and of changes in the chemical environment.

Moreover, when we consider lower animals and plants, we find that the environment to which they are exposed may be very different from the environment of a terrestrial mammal. Fishes may live at or near the surface of the ocean, or they may live at great depths; also, a fish may live in fresh water or in salt water. The ability of an aquatic animal to change from one type of environment to another is the same sort of a phenomenon as the ability of a terrestrial animal to change from one climate to another. Numerous investigators have tried to transfer fish, clams, crabs, etc., from salt water to fresh, or from fresh water to salt, and they have examined the conditions which favour the success of such transfers. Unless we choose to draw artificial distinctions between one type of organism and another, we must adopt a very broad definition of acclimatization, a definition that will include all types of organisms and all types of environments. Let us define acclimatization, therefore, as the process in which an organism or a part of an organism becomes accustomed or inured to an environment which is normally unsuitable to it or lethal for it. By and large, acclimatization is a relatively slow process. The term should not be taken to include relatively rapid adjustments such as our sense organs are constantly making. This type of adjustment is commonly referred to by the physiologist as "adaptation." Thus our touch sense soon becomes accustomed to the pressure of our clothes and we do not feel them; we soon fail to hear the ticking of a clock; obnoxious odours after a time fail to make much impression on us; and our eyes in strong light rapidly become insensitive.

On the other hand, when an adjustment to an unfavourable environment requires several generations, this is scarcely acclimatization in the strict sense (although often in the past it has been so considered). If a species of animal or plant is moved to an unfavourable environment, the individuals of the species may, after a number of generations, be better able to withstand the unfavourable conditions than were the animals and plants that first moved into the new environment. This may not so much be due to any change or acclimatization during the lifetime of the original animals or plants or their descendants, but rather to changes or mutations from generation to generation. Such mutations are now known to be of relatively frequent occurrence (*see* Evolution, Organic; Gene). The mutations which are more apt to prosper in a given environment will tend to survive (as a result of natural selection); the unfavourable mutations tend to die off. So, for example, if wheat plants are moved to an excessively cold climate, during successive generations if mutations appear which are better able to withstand the cold, these mutant plants are the ones which will survive. This type of natural selection is well known, and it can indeed be hastened by artificial selection on the part of the agriculturist. The end result is to produce new strains or races of a species, better able to withstand a particular environment than was the original species. We are dealing here with a phenomenon familiar to students of heredity. The change in the species is a very different process from the acclimatization change which occurs during the life of an individual. If one considers the behaviour of a species for a number of generations, it is hard to distinguish between the changes produced as a result of mutation followed by natural selection and the changes produced as a result of true acclimatization.

The fundamental fact about acclimatization is that all animals and plants have some capacity to adjust themselves to changes in their environment. This is one of the most remarkable characteristics of living organisms, a characteristic for which it is extremely difficult to find explanations. Adjustment can be made to high or low temperatures, to changes in pressure or to changes in chemical environment. These various kinds of adjustment will be considered separately. But before entering into a logical treatment of the various facts and theories concerning the different types of acclimatization, an attempt will be made to present a brief discussion of the ability of various animals and plants to change their habitat from one region of the earth's surface to another. This subject has been studied primarily from the viewpoint of human welfare and human economy.

**Acclimatization of Various Species, Including Man.**—Early writers on biology and natural history, as well as early travellers and explorers, were interested in the possibility of importing animals and plants from one country to another. Tobacco, originally found in America, was introduced into Turkey and other countries. Cotton likewise was transplanted. Rubber and quinine, originally produced in South America, became staple crops of the East Indies. Flowers and shade trees found their way from one country to another. So, too, horses were imported into the Americas, and various other domestic animals were introduced into different parts of the world. Sometimes noxious insects or other types of pests find their way into countries originally free from them. The entrance of such undesirable organisms is a matter of great economic importance, but from our point of view it has no great theoretical interest. An animal or a plant from a strange country may be successfully introduced into the homeland, or it may not be able to live there. Usually the important variable is temperature. Some animals seem to be able to exist anywhere. Thus, as Charles Darwin pointed out in his *Origin of Species*, rats and mice can live in very cold climates as well as in the tropics. Some other animals are very sensitive to changes of temperature. Possibly, in part at least, the ability of rats and mice to live in different climates is due to their nocturnal habits. Both rats and mice are quite sensitive to high temperatures and are much more readily killed by heat than are cats and cows. It is very doubtful if rats or mice could withstand any lengthy exposure to the rays of the tropical sun.

Years ago, as new countries were discovered and developed, societies were founded to promote the exchange of species of animals and plants from one part of the world to another. The most famous of these societies was the Societé d' Acclimatation in Paris. Not always is the introduction of a species attended with any difficulty. Some species thrive away from their natural habitat, often even better than in their homeland. In such instances there is no need for the species to become accustomed or inured to the new habitat, and in reality acclimatization does not occur. The organism becomes naturalized but not acclimatized (*see* NATURALIZATION OF PLANTS AND ANIMALS).

The question of human acclimatization has interested historians, geographers, sociologists and medical men. The early Greek writers wondered why white men did not successfully colonize tropical countries. The difficulties of white settlers in the tropics are manifold, and the problems are extremely complex. It is hard to distinguish between the direct adverse effects of climate and the deterioration and death caused by the many types of tropical disease. In addition, the white man in the tropics often has had to face the competition of coloured races perhaps more capable of withstanding the heat. Then, too, the conditions of life are often strange and difficult and this may be a factor in the causation of what has been called "tropical neurasthenia." In modern times, when sanitary and health conditions have been improved, as in Panama and in northeastern Australia (eastern Queensland), acclimatization of white settlers is favoured. Some medical authorities have urged that if tropical disease could be prevented, white men in the tropics would prosper. Others have insisted that, quite apart from disease, the climate itself is harmful. Women are said to be paler in the tropics. In very hot regions, according to some observers, the effects of old age appear earlier. Some physicians claim that old-age vision (presbyopia), which in temperate climates usually is not noticeable until a man reaches the age of 45, may become evident in Europeans in the tropics about 10 years earlier. Hot climates have also been blamed for premature loss of memory.

Surprisingly enough, little attempt has been made to study the conditions which favour successful existence in hot countries. Of course air conditioning can change the climate within the home, and this, along with the introduction of modern methods of transportation, may eventually be a partial solution of the practical problem of life in the tropics. But on the physiological side, our knowledge is meagre. All authorities are agreed that excessive use of alcohol is fatal for anyone who attempts to live under conditions of excessive heat. Some Australian experts believe that manual labour is helpful to the health of dwellers in the tropics. Because salt is lost through the sweat, men in the tropics and workers in industries in which they are exposed to high temperatures are urged to eat salt occasionally. Presumably there are benefits from this practice, but they are not very great. Diet may be an important factor in determining human resistance to heat. It is generally agreed that in warm climates there is an unconscious tendency for people to choose diets lower in protein and fat and higher in carbohydrates. Such a practice is perhaps beneficial and there may be a theoretical reason why it should be. This will be brought out later.

As is well known, men can to some extent become acclimatized to life at high mountain altitudes. This acclimatization is primarily an adjustment to the low oxygen concentration of the air over the mountains. When a man first ascends a high mountain, his heart beats faster, and he becomes breathless; he may also be nauseated and vomit, his head may ache and his nose may bleed. After a short stay, these symptoms of mountain sickness tend to disappear. The physiological adjustment is somewhat complex, but for one thing there is an increase in the ventilation of the lungs, so that more air passes through them in any given interval of time. Also, the haemoglobin of the blood comes to have a greater affinity for oxygen than it normally possesses. In addition, the actual concentration of haemoglobin in the blood increases.

**Heat.**—In general, animals show a very definite ability to become acclimatized to temperatures somewhat above those they can normally withstand. To cite but a single example out of many, the common American black bass (*Micropterus salmoides*), if it is kept in warm water at a temperature of 86° F. for four days, becomes more resistant to heat. Normally, when these fish are exposed to high temperatures, 50% of them die when exposed for an hour to a temperature of 93° F., whereas those kept in the warm water for four days reached their death point only at a temperature of 100° F. Thus, their tolerance to heat had been raised approximately 7° F. On the other hand, when the fishes were kept for 16 days at a temperature of 50° F., half of them died when exposed to a temperature of 86° F. for an hour. Other fishes show a similar behaviour. Toad tadpoles raised in the warmth were found to be able to stand temperatures about 6° F. higher than those raised in colder water. Lower animals show a somewhat similar behaviour. Thus, for example, protozoa can be acclimatized so that they will withstand temperatures 4° or 5° (F.) higher than those temperatures which normally kill them. In the summer, as might be expected, animals are commonly better able to resist heat than in winter. Thus, in the case of the common sand crab of the Massachusetts coast (*Emerita talpodia*), the lethal heat temperature is 18° higher in summer than it is in the winter.

The mechanism of heat acclimatization is uncertain. In man, changes in the sweating mechanism or in the blood circulation may play a part. But only a few mammals sweat, and acclimatization to heat is very generally exhibited by all sorts of organisms, even by those which completely lack blood. As a matter of fact, essentially all living cells are heat sensitive, and the temperatures which kill them are often only a few degrees above those at which they are accustomed to living. In lower animals heat death is simply due to the death of the constituent cells. In

higher animals, some cells appear to be more sensitive than others, and the death or injury of these cells apparently produces toxic substances which injure and eventually kill the animal as a whole. At any rate, this is a commonly held view. In general, those organisms which are killed at the higher temperatures have more solid fats; that is to say, fats with higher melting points. This is a broad truth which holds both for animals and plants Thus fishes, which die at relatively low temperatures, have fats fluid at ordinary temperatures; whereas the warm-blooded mammals and birds have solid fats. Similarly, plants which live in the tropics seem generally to have more solid fats than those which live in temperate climates. Various experimenters have shown that when animals are reared at higher temperatures, their fats tend to become more solid. Such a change in the melting point of the fats may be a factor in the acclimatization of animals and plants to heat. It should perhaps also be pointed out that recent nutritional studies have shown that if animals eat sugar, the fat produced within the body from this sugar has a high melting point. Thus a diet rich in carbohydrate should be favourable for men or animals in the tropics, and this may perhaps be correlated with the fact already noted that men in hot countries seem unconsciously to prefer such a diet.

**Cold.**—There have been relatively few studies on the ability of animals to become acclimatized to cold. Fishes accustomed to warm water are unable to withstand sudden transfer to cold water. At Naples, the eggs of the sea urchin (*Paracentrotus lividus*) can not develop at temperatures below 61° F. in summer, but in the wintertime these eggs can develop at temperatures as low as 47° F.

In agriculture, the ability of plants to become acclimatized to the cold is a matter of great practical importance. Tropical plants are killed at temperatures above freezing. In cold countries, plants frequently suffer injury from frost. As a result of breeding experiments, and as a result also of chance mutations, cold-resistant varieties of wheat and other crop plants have been obtained, and these varieties have made farming possible in regions where it might otherwise have been impractical. But even for any given variety of a plant, some increase in so-called cold hardiness is possible. For when plants are grown at lower temperatures they are better able to withstand frost. However, they should not be grown at temperatures too close to the freezing point, for this is apt to weaken them rather than make them more hardy. When plants are exposed to the cold, there may be an increase in the amount of sugar or salt contained in the plant cells, and such increases would tend to prevent freezing. Possibly also, in hardy plants water is prevented from freezing by an increased tendency for it to be bound chemically in such a way that it does not act like ordinary water. Some workers believe that cold hardiness is primarily due to an increase in the amount of this "bound water." However, this explanation does not seem to fit all cases. A protein jelly, such as a gelatin gel, does not freeze as readily as a fluid protein solution. It is possible, therefore, that the state of fluidity of the vital protoplasm may be a factor in determining cold hardiness. At any rate, this has been suggested.

**Marine and Fresh-Water Acclimatization.**—Ordinarily, animals which live in the ocean die rather rapidly if they are placed in fresh water; also fresh-water animals die in sea water. This is not always true, for the eel and the salmon can pass from sea water to fresh water and back again without injury. If fresh-water animals are placed in water containing a large amount of salt, they tend to lose water from their cells; and in the case of simpler animals, there is a considerable loss of water. This is due to a process called osmosis, and osmosis also causes an inflow of water into the cells of a marine animal placed in fresh water. As a matter of fact, the cells of all animals are in equilibrium with the solutions in which they are bathed. If these solutions become more dilute, the cells increase in volume; if on the other hand, the concentration of the solutions is increased, the cells lose water and shrink. Many higher animals are enclosed in stiff integuments which prevent the free passage of water to the constituent cells and such animals are less sensitive to changes in the salt content of the outer medium; although, of course, within the bodies of the animals the cells are in equilibrium with the blood or other fluids of the animal.

Sea water contains many types of salts, but by far the most abundant of these is ordinary table salt (sodium chloride); and the concentration of salt in sea water is approximately the same as that of a 3% solution of table salt. If fresh-water animals, normally incapable of living in sea water, are placed in a very dilute salt solution and then salt is gradually added over a period of weeks or even months, it is in some instances possible to acclimatize the animals so that they can live in solutions as salty as or even saltier than sea water. Also, by gradually adding fresh water to the sea water in which marine forms are living, they can be made to live in solutions whose lack of salt would ordinarily kill them rapidly. Many experiments of this sort have been performed. Different types of animals vary widely in their capacity to become acclimatized. All sorts of adjustments are involved. Presumably, with an increase in salt content of the surrounding medium, both the cells and the body fluids of the animals become richer in salt. An important factor is the ability of an animal to excrete salt. Ordinary fishes are able to excrete salt through their gills and this aids them in their adjustment to the salt water of their surroundings. On the other hand, the excretion of water by animals enables them to get rid of excess water taken in through the skin. Thus, a frog immersed in water is continually taking up water through the skin and excreting it by way of the kidneys. Thus, obviously, excretory processes may play a part in the ability of animals to accustom themselves to changes in the salt content of their watery environment.

**Chemical Acclimatization.**—All sorts of organisms show some power of accustoming themselves to a wide variety of poisons. Bacteria and protozoa may acquire an increased resistance to such substances as mercuric chloride, quinine, etc. Such acclimatization becomes a factor in the treatment of disease, for protozoan and bacterial parasites which are normally killed by a certain concentration of a drug may after a time become resistant. Bacteria and protozoa reproduce very rapidly—the average length of life of a bacterium is only about 20 min—and accordingly, in studies of acclimatization in these lower organisms, the acclimatized organisms are descendants of the original organisms. Thus, in such experiments new types of organisms may arise in successive generations as a result of mutation. Some of these new mutated types may be more resistant than the original forms, and these more resistant mutations would tend to be selected out; that is to say, they would show a greater tendency for survival. Accordingly, in experiments with bacteria and protozoa it is hard to distinguish between acclimatization in the strict sense and changes primarily due to mutation and natural selection.

In higher animals, true acclimatization to chemicals undoubtedly occurs. Mice and rabbits can become somewhat acclimatized to the presence of carbon monoxide in the atmosphere. Man can train himself to eat increasing amounts of certain poisons and he can then acquire a tolerance for these poisons. Tolerance to poisons has been widely studied by pharmacologists Various types of explanation are possible. Thus, it has been thought that when a tolerance to arsenic is acquired, there is less absorption of the poison from the intestine. Tolerance to alcohol may involve a decreased absorption, an increased or more rapid excretion, a decrease in the amount of alcohol which reaches the brain, or an increase in the rate at which alcohol is chemically transformed within the body. Modern studies tend to disprove all these possibilities, and apparently human tolerance for alcohol is primarily due to an acclimatization of the cells of the central nervous system.

Many living organisms produce poisonous substances. Thus, toadstools are notoriously poisonous and so too are many higher plants; as well as scorpions, spiders, snakes, etc. In general, the organism producing the poison is immune to its effects. A man can be made tolerant to some particular variety of snake poison; that is to say, he is made immune to it. Similar immunity may be acquired for various bacterial poisons. The attempt to understand this type of immunity is of such importance to bacteriology and medicine that an entire science has been built around it.

One of the most interesting types of chemical acclimatization is that shown by bacteria and yeasts toward food substances in their environment. Yeasts commonly live by fermenting sugars, but normally they are capable of utilizing certain types of sugars and not others. If a yeast colony be grown in a medium containing an unusual type of

sugar, one which it does not have the power to attack, after a time it may acquire this power.

**ACCOLADE**, a ceremony used in conferring knighthood; but whether it was an embrace (according to the use of the modern French word *accolade*), or a slight blow on neck or cheek, is not agreed. Gregory of Tours writes that the early kings of France kissed the knights on the left cheek; and William the Conqueror is said to have made use of the blow in conferring knighthood on his son Henry. At first it was given with the fist, but for this was substituted a gentle stroke with the flat of the sword on the side of the neck, or on either shoulder. In Great Britain the sovereign still employs this latter form. "Accolade" is also a technical term in music-printing for a sort of brace joining separate staves; and in architecture it denotes a form of decoration on doors and windows.

**ACCOLTI, BENEDETTO** (1415–1464), Italian jurist and historian, was born at Arezzo, in Tuscany. He was for some time professor of jurisprudence in the University of Florence, and in 1458 became chancellor of the Florentine Republic. In conjunction with his brother Leonardo he wrote in Latin a history of the first crusade, entitled *De Bello a Christianis contra Barbaros gesto pro Christi Sepulchro et Judaea recuperandis libri tres* (Venice, 1532; Italian trans., 1543; French trans., 1620), which, though itself of little interest, is said to have furnished Tasso with the historic basis for his *Jerusalem Delivered*.

His brother FRANCESCO (c.1416–c.1484) was also a distinguished jurist.

**ACCOLTI, BERNARDO** (1465–1536), Italian poet, born at Arezzo, was the son of Benedetto Accolti. Known in his own day as *l'Unico Aretino*, he acquired great fame as a reciter of impromptu verse. He was listened to by large crowds, composed of the most learned men and the most distinguished prelates of the age. His works were published at Florence in 1513 and have been several times reprinted.

His brother, PIETRO ACCOLTI (1455–1532), was made cardinal by Julius II. He was abbreviator under Leo X, and drew up in 1520 the bull against Luther. In 1524 he became archbishop of Ravenna.

Pietro's nephew, BENEDETTO (1497–1549), was also a cardinal, under Clement VII, and a writer of Latin verse.

*See* E. Guarnera, *Bernardo Accolti* (Palermo, 1901).

**ACCOMMODATION,** in theology has two chief meanings. (1) It is used to describe the method of adapting the presentation of truth to the learners' capacity. In a sense all revelation of God must be "accommodated" to man: the naked revelation would be so dazzling as to blind him. When Jesus withheld certain truths from the disciples because they could not yet bear them (John xvi. 12) he was practising accommodation. Teaching by symbol or parable, too, is accommodation. (2) When words used with a definite reference to one subject are applied to another subject we have accommodation in a more special sense. Thus Matthew ii. 15 states that Jesus was taken to Egypt that the word of the prophet, "Out of Egypt did I call my son," might be fulfilled: but the prophecy quoted, Hosea xi. 1, quite clearly means Israel by "my son."

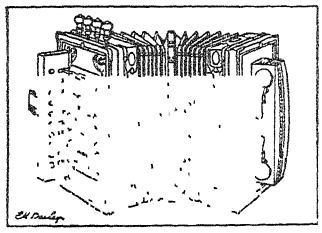
In biology accommodation is used to describe adjustments achieved by an individual organism over and above those which it makes as part of its inheritance. In psychology it means "the process by which habit is modified, cancelled and added to" (J. M. Baldwin).

For accommodation in optics *see* OPTICS.

**ACCOMMODATION BILL:** *see* BILL OF EXCHANGE.

**ACCOMPANIMENT,** a musical term for that part of a vocal or instrumental composition added to support and heighten the principal vocal or instrumental part; either by means of other vocal parts, single instruments or the orchestra. Owing to the early custom of only writing the accompaniment in outline, by means of a figured bass (*q.v.*), to be filled in by the performer, and to changes in the number, quality and types of the instruments of the orchestra, "additional" accompaniments have been written for the works of some of the older masters, such are Mozart's "additional" accompaniments to Handel's *Messiah* (*see* article on HANDEL). In the case of songs an accompaniment may consist merely of a few chords of the simplest kind or take the most elaborate form and constitute the most striking feature of the composition. In the latter case the performance of such accompaniments calls for the highest skill and constitutes a distinctive branch of the pianist's art, demanding the amplest powers of execution and first-class musicianship, especially when the player is called upon, as sometimes happens, to transpose a difficult accompaniment at sight for the convenience of the singer. Accompanying is also an important branch of conducting, in the case of concertos, choral music, and so forth.

**ACCOMPLICE,** in law, one who is associated with another or others in the commission of a crime, whether as principal, abettor, or accessory (*q.v.*). Although the uncorroborated evidence of an accomplice is admissible in law, and may be acted upon by a jury, it is the duty of the judge to warn the jury that it is always dangerous to convict on such evidence, and he should advise them not to convict (*R.* v. *Baskerville*, 25 Cox. C C. 524).



**ACCORAMBONI, VITTORIA** (1557–1585), an Italian lady famous for her great beauty and accomplishments and for her tragic history. She was born in Rome of a family belonging to the minor *noblesse* of Gubbio, which migrated to Rome. After refusing several offers of marriage for Vittoria, her father betrothed her to Francesco Peretti (1573), a nephew of Cardinal Montalto, who was regarded as likely to become pope. Vittoria was admired by the most brilliant men in Rome, and being luxurious and extravagant she and her husband were soon plunged in debt. Among her admirers was P. G. Orsini, duke of Bracciano, and her brother Marcello, wishing to see her the duke's wife, had Peretti murdered (1581). The duke himself was suspected of complicity as he was believed to have murdered his first wife Isabella de' Medici. They were married shortly after. But attempts were made to annul the marriage; Vittoria was imprisoned, and only liberated through the interference of Cardinal Carlo Borromeo. On the death of Gregory XIII., Cardinal Montalto, her first husband's uncle, was elected in his place as Sixtus V. (1585); he vowed vengeance on the duke of Bracciano and on Vittoria, who, warned in time, fled first to Venice and thence to Salò in Venetian territory. Here the duke died in Nov. 1585, bequeathing all his personal property to his widow. Vittoria, overwhelmed with grief, went to live in retirement at Padua, where she was followed by Lodovico Orsini, a relation of her late husband and a servant of the Venetian republic, to arrange amicably for the division of the property. But Lodovico hired a band of bravos and had Vittoria assassinated (Dec. 22, 1585). He himself and nearly all his accomplices were afterwards put to death by order of the republic.

About Vittoria Accoramboni much has been written and she has been greatly maligned by some biographers. Her story formed the basis of Webster's tragedy, *The White Devil* (1612), and of Ludwig Tieck's novel *Vittoria Accoramboni* (1840); it is told in D. Gnoli's vol. *Vittoria Accoramboni* (Florence, 1870), and an excellent sketch of her life is given in Countess E. Martinengo-Cesaresco's *Lombard Studies* (London 1902).

**ACCORD,** in law, an agreement between two parties, one of whom has a right of action against the other, to give and accept in substitution for such right any good legal consideration. Such an agreement when executed discharges the cause of action and is called *Accord and Satisfaction*. This specific form of pleading is obsolete in England.

**ACCORDION,** a small portable reed wind instrument with keyboard, one of the smallest members of the organ family, invented in 1829 by Damian, in Vienna. It consists of a bellows of many folds, to which is attached a keyboard with from five to 50 keys. The keys on being depressed, while the bellows are being worked, open valves admitting the wind to free reeds, the pitch of the note being determined by the length and thickness of the reeds. The right hand plays the melody on the keyboard, while the left works the bellows and manipulates the two or three bass harmony keys, which sound the simple chords of the tonic and

dominant. The archetype of the accordion is the cheng (*q.v.*) or Chinese organ, between which and the harmonium it forms a connecting link structurally. Improvements in the construction of the accordion produced the concertina (*q.v.*), melodion and melophone.

THE ACCORDION, ONE OF THE SMALLEST MEMBERS OF THE ORGAN FAMILY, WAS INVENTED BY DAMIAN, A VIENNESE, IN 1829

**ACCORSO** (ACCURSIUS), **MARIANGELO** (*c.* 1490–1544), Italian critic, was born at Aquila in the kingdom of Naples. He was a great favourite with Charles V., at whose court he resided for 33 years, and by whom he was employed on various foreign missions. He was the first editor of the *Letters of Cassiodorus*, with his *Treatise on the Soul* (1538); and his edition of *Ammianus Marcellinus* (1533) contains five books more than any former one. The affected use of antiquated terms, introduced by some of the Latin writers of that age, is humorously ridiculed by him, in a dialogue in which an Oscan, a Volscian and a Roman are introduced as interlocutors (1531).

**ACCOUNT,** a term of very various use in book-keeping, banking and stock exchange terminology (*see* BANKING AND CREDIT) indicating counting, reckoning, especially of moneys paid and received, hence a statement made as to the receipt and payment of moneys The following are some of its chief usages:—

*Balanced account,* an account in which the total debits equal the total credits and which has been ruled off to indicate that fact.

*Balancing account,* an account contained in a subsidiary ledger which shows in aggregate and also in reverse, as to debit and credit, the total of the detail accounts. The use of such an account makes a ledger self-balancing. The information contained in a balancing account is essentially that found in a *controlling account* although the debits and credits appear in reversed order in the *balancing account.*

*Closed account,* same as balanced account.

*Contra account,* an account of contrary tendency which must be considered with another account because of an interlocking relationship. For example, a customer of a business may also be a creditor. If the amount he owes as a customer is less than the amount that is due him as a creditor, the business may remit a check for the net amount. The term used in referring to the amount due from the customer in this case is *contra account.*

*Controlling account,* an account in the general ledger which reflects in aggregate the details of two or more accounts of the same tendency. Ordinarily the underlying accounts are operated in a subsidiary ledger.

*Impersonal account,* an account which is not a *personal account.* Any expense or income account is an impersonal account.

*Mixed account,* an account containing two or more separate classes of transactions. The "merchandise account," for example, contains a record of purchases, sales, purchase returns, purchase allowances, sales returns, sales allowances, freight and cartage, etc. In modern accounting, a separate account called a *simple account* is maintained for each class of transactions.

*Nominal account,* an account which reflects a change in the financial condition of a business. Thus, it is an account which finally finds its way into the profit and loss account; *e.g.,* sales, purchases, interest, discount, salaries, wages, commission and advertising expense. All of the accounts appearing in a statement of income, and profit and loss, are *nominal accounts.*

*Open account,* an account which is not in balance, *i.e.,* an account containing a debit or a credit excess; opposite of *closed account.*

*Personal account,* an account operated under the name of an individual, an organization or a business enterprise.

*Private Account,* an account maintained in a Private Ledger. Information of a confidential nature which ought to be shown on the accounting records can best be treated in the private set of accounts.

*Real account,* an account used in displaying the financial status of a business. All accounts used in a "balance sheet" are real accounts; thus they represent assets, liabilities and capital.

*Simple account,* an account containing entries relating to a single class of transactions; opposite of mixed account. Sales returns, purchase allowances, interest on notes receivable and administrative salaries are *simple accounts.* (*See* ACCOUNTANCY AND ACCOUNTANTS; BOOKKEEPING )

As a stock exchange term, "account" is used in several senses:—

(1) The periodical settlements occurring, in London, monthly for British Government and a few other first-class securities, and fortnightly for all others.

(2) The period between two settlements. A 19-day account is one in which 19 days elapse between one pay day and another.

(3) The volume or condition of commitments. A speculator is said to have a large account open when he has dealt heavily either for the rise or fall.

An account is also any statement as to acts or conduct, or quite simply any narrative report of events, etc. A further sense-development is that of esteem, consideration. (G. L. C.)

**ACCOUNTANCY AND ACCOUNTANTS.** Originally, accountancy was the same thing as account-keeping or bookkeeping, and "accountant" and "bookkeeper" were interchangeable terms, but an increasing recognition of the importance of accounting in the development of modern business methods has led here, as elsewhere, to the division of labour. In the early days of navigation it was doubtless reasonable to assume that the man who navigated a canoe was in all probability also the man who designed and constructed it: to-day, the distinctions between the engineer officer, the naval architect and the shipbuilder are clearly defined and well recognized. Much the same process of evolution has been going on in the accountancy world, and although the distinction may not yet be universally accepted, it may be stated that, whereas the bookkeeper is the person who keeps the books or accounting records of an undertaking, the accountant is rather the person who decides how such records ought to be kept. The term accountancy is now generally applied to all the work that falls to the lot of the accountant, although under modern conditions (as is shown later on) that work is now exceedingly varied and often extends far beyond the region of accounts.

**Early History.**—Very little is known of the origin of accountancy as a profession. In the modern acceptation of the word, however, a professional man is one who places his skill and learning at the disposal of all and sundry for a reward, as distinct from one who serves a single employer. Accordingly, while there are several references in mediaeval and even classic times to stewards and auditors, these references do not throw much light upon the origin of professional accountancy, as the persons referred to were manifestly in the whole-time employment of a single individual or body. The first association of accountants of which there is any record is the *Collegio dei Raxonati,* which was founded in Venice in 1581, but it is by no means certain that the members of this body were professional or public accountants, or whether they were not rather employees of public bodies. At Milan, however, in 1742, the Government established a scale of charges for accountants, so it may be assumed that then, if not earlier, professional accountancy (as here defined) actually existed in that city. It has been said that the first Scottish professional accountant was one George Watson, born in Edinburgh in 1645; but whether he was really able to carry on a practice as a professional accountant in addition to his "large private banking business" seems somewhat doubtful. Holden's *Triennial Directory of London, Westminster and Southwark* was first published in 1799, and contains the names of 11 accountants. The *British Universal Directory,* published in 1790, had given the names of five accountants only. It seems clear, therefore, that there was very little professional accountancy in London before the 19th century, and in the issue of *Holden* for 1822 the number of practising accountants had only risen to 73. Indeed, little progress was made by professional accountancy in Great Britain, or elsewhere, until the middle of the 19th century, when (so far at least as Great Britain is concerned) it received a great impetus from

the growth of limited liability companies, and a little later from the Bankruptcy Act, 1869, which to a very large extent withdrew the administration of insolvent estates from the hands of public officials. The advent of the limited liability company led to business operations being undertaken upon a scale which had formerly not been thought of. The proper control of these large scale operations naturally called for better accounting systems than had formerly been deemed adequate.

**Organization.**—The first step in the direction of organizing professional accountancy in Great Britain was taken when the *Society of Accountants* in Edinburgh was incorporated by Royal Charter in 1854. Similar societies in Glasgow and Aberdeen were also incorporated by Royal Charter in 1855 and 1867 respectively. Each of these bodies, however, had assigned to it definite geographical limitations, although the individual members of all three may, and do, practise in various parts of the world. The *Institute of Accountants* was formed in London in 1870, was incorporated by Royal Charter in 1880 as *The Institute of Chartered Accountants in England and Wales,* provision at the same time being made for all accountants then practising in England or Wales to become members. *The Society of Incorporated Accountants and Auditors* was registered under the Companies Act in 1885. (For particulars of these and other bodies *see* ACCOUNTANTS' SOCIETIES.) *The Institute of Chartered Accountants in Ireland* was incorporated in 1888.

**Accountancy Elsewhere.**—But little development has as yet taken place on the continent of Europe as regards professional accountancy, but professional bodies have existed in Holland, Sweden and Belgium since 1895, 1899 and 1903 respectively. Most British colonies have one or more professional bodies of their own.

**Duties.**—It has been stated that originally accountants were bookkeepers. Hence, naturally, as soon as the necessity or desirability of checking, criticizing or auditing the records of accounting parties was appreciated, skilled accountants whose probity could be relied upon would naturally be selected for the work. In the first instance, accordingly, professional accountants were in the main auditors of other people's accounts. Where the auditing was not a whole-time job there were obvious economies in securing the services of a professional accountant, while the fact that he was a professional accountant ensured his independence. As, however, the centre of gravity tended to shift in Great Britain from agriculture to industry, the professional accountant found thrust upon him an ever-enlarging sphere of activities over and above his primary function as an expert in accounts. Thus, professional accountants are frequently called upon to design systems of accounting (in recent times increasingly mechanized) for new or growing concerns; to assist in the establishment of an adequate system of cost accounts; to prepare business statistics; to investigate accounts in connection with partnership changes, the amalgamation of business interests, or the flotation of companies formed to acquire established businesses; to deal with compensation cases on the compulsory purchase of businesses by railway companies or public bodies; to give expert evidence on matters relating to accounts; to prepare accounts for the use of counsel; and to act as arbitrators in differences relating to matters of accounts or finance. Besides acting as directors of companies, dealing mainly with financial affairs, they also very frequently act as secretaries of companies whose operations are not upon a sufficiently large scale to justify a whole-time appointment, and the accounts of executors and trustees under wills and settlements are often kept by professional accountants. In addition, professional accountants act as trustees in bankruptcy; trustees under deeds of arrangement; liquidators of companies; receivers for debenture holders; and managers of businesses where a receiver is in possession of the assets.

**Mode of Entering the Profession.**—Anyone desirous of becoming an English chartered accountant must first serve under articles with a practising member for five years, or three years in the case of graduates. A premium of from 150 to 500 guineas is usually required. Before signing articles, the pupil must have passed the preliminary examination of the Institute, or some accepted equivalent of matriculation standard. After half the period of articles has expired, the pupil may submit himself for his intermediate examination in general commercial knowledge, bookkeeping and accounts and auditing; on the termination of his articles, before admission as a member, he must pass his final examination in advanced bookkeeping and accountancy (including costing and taxation); auditing; partnership and executorship law and accounts (including the rights and duties of executors, trustees and receivers); bankruptcy and company law; the principles of mercantile law and the law of arbitrations and awards; and either (*a*) economics, (*b*) banking, currency and foreign exchanges or (*c*) actuarial science. The regulations of the Society of Incorporated Accountants and Auditors similarly provide for articles of clerkship with a practising incorporated accountant, and the society's examinations must be passed For candidates who for any reason are unable to enter into articles, the society provides an alternative method of qualifying by nine years' approved experience in lieu of five years' articles. The nine years' experience must be gained in the office of a practising incorporated or chartered accountant, or—subject to certain conditions—of a municipal or county treasurer or accountant.

The regulations of Scottish chartered accountants as to admission, etc., are upon similar lines, there being a general examining board which deals with candidates articled to members of all three bodies. In Scotland as a rule no premium is charged, but no salary is paid during the period of articles. The Institute of Chartered Accountants in Ireland also has similar regulations.

**Statutory Regulations.**—In New Zealand and the Transvaal there are statutory registers of public accountants, and only those upon the register are permitted to undertake certain specified accountancy duties. The registration of professional accountants has been mooted at various times from 1889 onwards, but opinions are so divided as to its desirability that statutory registration in Great Britain seems as far off as ever.

Dicksee, *The Fundamentals of Accountancy* (1921); *The Accountant,* vol. i. (1877); *The Accountants' Journal,* vol. i. (1883); *The Accountants' Magazine,* vol. i. (1897); *Incorporated Accountants' Journal,* vol. i. (1889). (L. R. D.)

**United States.**—Accountancy, in the United States, is among the newer professions. In the short time of its existence it has not acquired the traditions which characterize such of the older professions as law, medicine and theology. The first formal recognition was given to accountancy in the laws of New York State in April 1896. Since that time all of the States have officially recognized the public accountant by creating the title, certified public accountant (C.P.A.), such title to be granted or awarded to applicants who satisfy the requirements regarding character, education and professional skill of the State in which recognition is sought. While there is still a lack of uniformity among the several States in the matter of requirements, there is a constant tendency toward greater strictness as laws are modified and new legislation enacted.

As indicative of the requirements imposed by State laws, the following summary sets forth the standard maintained by New York State: (*a*) an applicant for the certificate of certified public accountant must submit evidence that he is over 21 years of age and of good moral character; (*b*) he must have completed at least four years of high-school and since January 1, 1938, must also have completed a course in a college of accountancy registered by the department of education; (*c*) he must submit evidence of five years' experience in accountancy, at least two of which must have been in the office of a certified public accountant and of no less grade than that of junior accountant; such two years' accounting experience must have been in the office of a certified public accountant in this State or in the office of one residing in another State holding a certificate from such State granted on no lower requirement than that of this State, and he must submit evidence of three years' experience attained prior to his admission to the C.P.A. examination; (*d*) he must take professional examinations conducted by the State department of education in the following subjects: theory of accounts, auditing,

practical accounting and commercial law. The passing grade in each subject is 75% A candidate who fails in one subject only may take a subsequent examination in that subject to be given within two years from the date of the examination at which he passed the other three subjects.

In the United States, as in other countries, a high standard of professional ethics is fostered. The accountant acting as custodian of his client's interests must safeguard them in every legitimate way. His service to the client carries with it a strict responsibility to the client which cannot be divided or escaped. Confidences of the client must be held inviolable. The acceptance of contingent fees is frowned upon by members of the profession. As an obligation to the client, the accountant must keep himself informed on current developments in the profession.

Education for accountancy, in the United States, was formally provided for as early as 1881. In that year the Wharton School of Finance and Economy of the University of Pennsylvania was established. In 1898 the University of Chicago opened its College of Commerce and Politics (later known as the School of Commerce and Administration), and the University of California its College of Commerce. Two years later there were established at New York university the School of Commerce, Accounts and Finance; at Dartmouth college the Amos Tuck School of Administration and Finance; and at the University of Vermont, a department of economics and commerce. In the first quarter of the new century business education developed throughout the entire country so that at the opening of the year 1925 about 183 American colleges and universities provided instruction in business. In practically all of these schools, education for accountancy has dominated the business curricula.

*See* T. A. Budd, *The Interpretation of Accounts* (1927); R. B. Kester, *Accounting Theory and Practice* (1933) and Sanders, Hatfield and Moore, *Statement of Accounting Principles* (1938).

(J. T. MA.; X.)

**ACCOUNTANT-GENERAL,** a former official of the court of chancery, whose duties have been transferred to the paymaster-general.

**ACCOUNTANTS' SOCIETIES.** Under British law there is no restriction on the right to practice as an accountant, although the designations of the recognized professional bodies (*e.g.*, "chartered" and "incorporated" accountant) are protected by decisions of the courts, which have confined their use to members of the body concerned.

Until the passing of the Local Government Act, 1933, generally speaking only chartered or incorporated accountants could audit the accounts of municipal corporations, but under that act a municipal corporation may adopt either the system of district audit (by district auditors of the Ministry of Health) or professional audit. In the latter event the auditors must be members of one or more of the following: (1) Institute of Chartered Accountants in England and Wales, incorporated by royal charter in 1880; (2) Society of Incorporated Accountants and Auditors, incorporated in 1885, and with branches throughout the British Dominions; (3) Society of Accountants in Edinburgh (the earliest, formed in 1854); (4) Institute of Accountants and Actuaries in Glasgow; (5) Society of Accountants in Aberdeen; or (6) The Association of Certified and Corporated Accountants, formed in 1939 by the amalgamation of the Corporation of Accountants and the London Association of Accountants. There are other statutory limitations on the right to act as auditor in certain cases. No qualification is laid down for the auditors of limited companies, but it is usual for such appointments to be made from among the members of the older bodies There is a body of chartered accountants in Eire.

**United States.**—In the United States there are societies of certified public accountants. In addition to the various State societies there are several important national organizations the chief of which, the American Society of Certified Public Accountants and the American Institute of Accountants, were amalgamated in 1937 under the latter title. The National Association of Cost Accountants is composed of professional accountants and others whose interests lie in the cost phases of accounting. For information regarding American professional requirements, *see* ACCOUNTANCY AND ACCOUNTANTS.

**ACCOUNT CURRENT,** a running account which is likely to extend over an interminable period and which, if balanced, is usually opened again immediately; *e. g.*, a holding company which markets merchandise may have an account current with a subsidiary company which manufactures a product. The entire output of the factory may be turned over to the holding company and periodic charges made for merchandise thus transferred. The holding company may make advances from time to time to cover values received. Thus the account may not be in balance for a considerable time although an accurate statement of debits and credits will always be available in the account current. Merchants who sell on consignment frequently maintain accounts current with their consignees. An account current differs from the usual trade account in that the latter is usually settled at regular intervals, monthly, seasonally or otherwise. (G. L. C.)

**ACCOUNT RENDERED,** an expression used in referring to an account a statement of which has already been delivered to the customer. In business it is customary, for the purpose of verification, to send to each customer whose account is not in balance a statement showing the debits (charges) and credits for the current period (usually one month). If this balance is not liquidated before the end of the following period, the next statement of account has as its first entry "Account rendered" or "To account rendered" and the unpaid balance is shown. Thus an economy of time results because it becomes unnecessary to include all items arising since the account was last in balance.

(G. L. C.)

**ACCOUNT SALES,** a financial statement rendered by a merchant who has received goods on consignment showing sales, charges (usually commission and guaranty), and a net amount either credited to consignor's account or remitted by cheque. This form of financial statement is used extensively by commission merchants and factors and serves the consignor or principal as a basis for accounting.

| E.&O.E. | Net proceeds by cheque enclosed | | $1,340.00 |

(G. L. C.)

**ACCOUNTS PAYABLE,** in accounting terminology, amounts owed by a business to its creditors and not evidenced by notes, bonds, acceptances or other recognition. Loans from officers or partners of an enterprise should be considered as loans payable rather than accounts payable; creditors' accounts with debit balances should be listed as other accounts receivable rather than as a deduction from accounts payable. In its broader sense, the term includes amounts received in advance for merchandise that has not been shipped, rentals received in advance, etc.

**ACCOUNTS PAYABLE LEDGER,** a subsidiary ledger containing the accounts of creditors. It is a device used to facilitate the bookkeeping of a business enterprise. The operation of this type of ledger makes possible a division of labour in an accounting department; the work of posting to creditors' accounts can be carried on independently of the work on customers' accounts and general ledger accounts. The sum of the account balances in the accounts payable ledger should agree with the balance of accounts payable controlling account as shown in the general ledger. (*See* BOOKKEEPING.) (G. L. C.)

**ACCOUNTS RECEIVABLE,** in accounting terminology, amounts due to a business by its trade debtors for merchandise sold to them, or for services rendered, on a credit basis. It should be noted that only obligations arising from trade transactions should be included. Loans to officers of a company should be considered as loans receivable rather than accounts receivable; creditors' accounts with debit balances should be listed as other accounts receivable rather than as a deduction from accounts payable. In the preparation of a balance sheet, this term, without qualification may be assumed to represent items which can be collected within a period usual to the trade or industry of which the business is a part. In its broader sense, the term includes all unsettled claims against debtors which are not represented in the form of bonds, promissory notes or trade acceptances

(G. L. C.; X.)

**ACCOUNTS RECEIVABLE LEDGER,** a subsidiary ledger containing the accounts of customers. In a business organization which sells on credit to many customers, it is impracticable to keep customers' accounts in the general ledger The necessity of having several clerks posting the accounts at the same time makes a segregation imperative An additional advantage lies in the greater ease with which errors can be localized. In a small business with a limited number of accounts, one accounts receivable ledger will suffice; in a larger business involving many thousands of accounts, 15 or 20 customers' ledgers may be required. The grouping of accounts is usually arranged on an alphabetical basis; *e.g.*, if two such ledgers are used, one would contain accounts of customers whose names start with letters from A–K, and the other, L–Z. Sometimes the grouping is arranged on a territorial basis; *e.g.*, a separate ledger might be kept for the customers served by each branch office of a business, in which case the names would be arranged alphabetically in each ledger. The accounts receivable ledger is kept in agreement with the general ledger by means of controlling account; the total of the balances of customers' accounts should agree with the balance in the controlling account. Ordinarily, a separate controlling account is kept for each accounts receivable ledger. (*See* BOOKKEEPING.)

(G. L. C.)

**ACCOUTREMENT** (a French word, probably derived from *à* and *coustre* or *coutre,* an old word meaning one who has charge of the vestments in a church), clothing; apparel; a term used especially, in the plural, of the military equipment of a soldier other than his arms and clothing.

**ACCRA,** capital and largest city of the Gold Coast dependency. Pop.: 135,456, census of 1948 (2,712 non-Africans). Although situated only 5° 37′ N. (0° 10′ W.), it benefits from being on the one reach of the Guinea coast having a marked dry season and small annual rainfall (29 in. falling on 68 days), and correspondingly sparse vegetation. Originally, and still, an African fishing station, it takes its name from *Nkran* (ant), by which the inhabitants were known to the tribesmen of the forested interior. Its site is a wave-cut cliff 25 to 40 ft. high, which projects at three readily defensible points to form coves that provide partial shelter for the landing of dugouts and surfboats. For three centuries after the Portuguese built the first European fort, about 1565, control of these landing places was hotly contested. Between 1642 and 1673 the Danes fortified the easternmost promontory (Christiansborg), the Dutch built Ft. Crèvecoeur 1½ mi. to the west; and the English erected Ft James on the point ½ mi. farther along. After changing hands repeatedly in combat, the first two were purchased by the British government from their original owners in 1850 and 1868, respectively. The capital of Gold Coast colony (the coastal settlements) was brought from Cape Coast castle (*q.v.*) in 1876. Administration of the remaining area of the dependency was added: Northern Territories protectorate in 1897, Ashanti in 1901 and Togoland mandate in 1922. Christiansborg remains as the compound in which Government House has been built. Parts of the other forts exist in downtown Accra. Africans occupy most of the older residential area near the business district, and suburbs have been laid out exclusively for them within a mile or two. The land between the town and Christiansborg is devoted to public purposes, largely administrative functions. Adjacent and on higher ground stands the European residential quarter Beyond it is the military headquarters of the dependency, and an airfield used for regular service after 1937 by Imperial Airways During World War II this dry and open plain was converted into an air base to serve as the principal landing for planes crossing the Atlantic, and as the West African headquarters for the United States air transport command.

Six miles north of the centre of town is Achimota, where the Prince of Wales college was opened in 1927. It is the ranking educational institution in west Africa, teaching Africans from kindergarten through college Government services, not duplicated elsewhere in the dependency, include a hospital where nurses are trained, a training depot for policemen, an asylum for mental cases, the Central Agricultural laboratory and the supreme court. Water is piped throughout the settlement, and there are municipal baths.

A jetty about 450 yd long extends the protection of the Ft James promontory by further reducing the impact of the surf along the harbour front. In its lee a lighterage pier reaches beyond the breakers, but need be used only during the season of highest surf. The leading export is cacao, most of which comes by rail from points as far inland as the terminus, Kumasi. Roads usable throughout the year reach all sections of the dependency, but many are roundabout.

Under the constitution inaugurated in 1945, Accra elects two of five municipal members of the governor's legislative council. The municipal council, set up in 1894, was reconstituted in 1943 with a majority of African members and also a majority of elected members.

(D. WH.)

**ACCRETION,** an addition to that which already exists; increase in any substance by the addition of particles from the outside. In law, the term is used for the increase of property caused by gradual natural additions, as on the seashore or on a riverbank or by the formation of a riverine island. (*See* ALLUVION.)

**ACCRINGTON,** municipal and parliamentary borough, Lancashire, England, 23 mi. N.W. of Manchester, on the London Midland region railway route. Population (1951) 40,671. Area, 6·9 sq mi. It lies in a deep valley on the Hindburn, a feeder of the Calder.

Accrington (Akerenton, Alkerington, Akerington) was granted by Henry de Lacy to Hugh, son of Leofwine, in Henry II's reign, but came again into the hands of the Lacys, and was given by them (*c.* 1200) to the monks of Kirkstall, who converted it into a grange. It returned to the Lacys in 1287, was granted in parcels and, like their other lands, became merged in the duchy of Lancaster. In 1836 Old and New Accrington were merely straggling villages with about 5,000 inhabitants. By 1861 the population had grown to 17,688 because of the railway junction, and it increased with the rapid development of the Lancashire coal field. Cotton spinning and printing works, cotton-mill machinery works, dye works, collieries and transport work employ the people. A girls' high school was opened in 1939. The Church of St. James dates from 1763. The original chapel was probably an oratory which was an offshoot of Kirkstall abbey. Ecclesiastically, Accrington was dependent on Altham till after the middle of the 19th century. The town was incorporated in 1878. Together with the urban districts of Church, Clayton-le-Moors and Oswaldtwistle, Accrington returns one member to parliament.

**ACCRUED DIVIDENDS,** the amount of the dividend on a stock which may be presumed to have been earned during the period between the last dividend payment and a later stipulated date. Of course such an accrual of dividend is a mere presumption since dividends are necessarily uncertain until, at the end of a dividend period, it has been ascertained that there is a surplus from which to pay one, and it has been duly declared. It is quite unusual to sell stock for a certain price plus accrued dividends, although in the cases of stock with dividend guaranteed (*see* STOCK) or in cases of preferred stock of companies in which the dividend is practically certain, it is sometimes done. Stocks are not sold with accrued dividend on organized exchanges, although it is the common custom to sell bonds with accrued interest

(*q.v.*) The term accrued dividend must not be understood to carry intimation that dividends are in arrears (*q.v.*), that idea being conveyed by the expression cumulated dividend or accumulated dividend (*q.v.*) (*See* DIVIDENDS.) (J. H. B.)

**ACCRUED EXPENSES.** Some business costs are of a continuous nature, such as wages, interest, rent, etc. The accountant records in a summary entry (usually at the close of a period) the cumulative effect of these transactions for the relevant period. The debit may be to an expense account or, if the cost is to be capitalized as an element of inventory or fixed asset, to an asset account. The credit is usually to a liability, the resulting wages payable, etc., is referred to as an accrued expense payable and appears on the statement of financial position. In a larger sense, all costs accrue, and those which are incurred in earning the revenue of a period are allocated to that period as expenses. (P. KR.)

**ACCRUED INCOME,** or ACCRUED REVENUE. Certain business transactions are of a continuous nature, such as the earning of interest or of rent. The accountant records in a summary entry (usually at the close of a period) the cumulative effect of these transactions for the relevant period, usually by a debit to a receivable and a credit to a revenue account. The resulting interest receivable, etc., is referred to as accrued income or accrued revenue receivable. It appears on the statement of financial position. In a larger sense we say that all revenues from sales of goods and services accrue and are recorded during the accounting period. (P. KR.)

**ACCRUED INTEREST,** the amount of interest on a bond which has been earned over the period from the date of the last interest payment to some specified date, but which will not be paid by the issuer of the bond until the next regular interest date. Bonds are almost invariably sold at a certain price plus accrued interest. Thus if the interest dates on a certain bond are Feb. 1 and Aug. 1, and the bond is sold on May 1, the buyer will pay the seller the stipulated price plus the interest for the three months during which the seller's money has been invested in the bond, and on Aug. 1 he will receive from the issuing corporation the full six months' interest for the period from Feb. 1 to Aug 1. Half of this interest will repay the buyer for the accrued interest which he paid to the seller, and the other half will be the interest for the three months during which his own money was invested in the bond. By specific agreement or notification bonds may be sold "flat"; *i.e.*, without considering any accrued interest. Defaulted bonds and income bonds are usually sold flat since the interest to be received from them, if any, is always problematical. (J. H. B.)

**ACCUMULATED DIVIDEND,** dividend on cumulative stock which was due but was not paid during one or more previous dividend periods. Such unpaid back dividends accumulate and it is essential that they be paid in full before any dividend can legally be paid on the common stock. (*See* CUMULATIVE PREFERENCE SHARE; DIVIDENDS.)

**ACCUMULATION,** in law, the continuous adding of the interest of a fund to the principal, for the benefit of some person or persons in the future. Previous to 1800 this accumulation of property was not forbidden by English law, provided the period during which it was to accumulate did not exceed that forbidden by the law against perpetuities; viz., the period of a life or lives in being, and 21 years afterward. In 1800, however, the law was amended in consequence of the eccentric will of Peter Thellusson (1737–97), an English merchant, who directed the income of his property, consisting of real estate of the annual value of about £5,000 and personal estate amounting to more than £600,000, to be accumulated during the lives of his children, grandchildren and great-grandchildren, living at the time of his death, and the survivor of them. The bequest was held valid (*Thellusson* v. *Woodford*, 1798, 4 Vesey, 237).

To prevent such a disposition of property in the future, the Accumulations act, 1800 (known also as the Thellusson act) was passed, by which (as altered and re-enacted by the Law of Property act, 1925) it was enacted that no property should be accumulated for any longer term than either (1) the life of the grantor or settlor; or (2) the term of 21 years from his death; or (3) during the minority of any person living or *en ventre de sa mère* at the time of his death; or (4) during the minority of any person who, if of full age, would be entitled to the income directed to be accumulated. The act does not extend to any provision for payment of the debts of the grantor or of any other person, nor to any provision for raising portions for the children or remoter issue of the settlor, or any person interested under the settlement, nor to any direction touching the produce of timber or wood. It does not apply to property in Ireland. The act has been amended by the Accumulations act, 1892, which forbids accumulations for the purpose of the purchase of land for any longer period than during the minority of any person or persons who, if of full age, would be entitled to receive the income. The Accumulations act, 1800, was applied to heritable property in Scotland by the Entail Amendment act, 1848, and the saving clause as to provision for payment of debts was disapplied to Scotland by the Entail act, 1914. Accumulations act, 1892, applies to Scotland. (*See* TRUST AND TRUSTEES.)

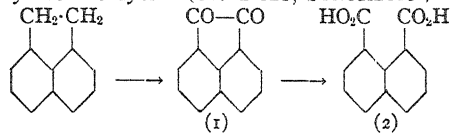
**ACCUMULATIVE STOCK:** see CUMULATIVE PREFERENCE SHARE.

**ACCURSIUS** (Ital. ACCORSO), **FRANCISCUS** (1182–1260), Italian jurist, was born at Florence about 1182. A pupil of Azo, he first practised law in his native city, and was afterward appointed professor at Bologna, where he had great success as a teacher. He undertook the great work of arranging into one body the almost innumerable comments and remarks upon the Code, the Institutes and Digests, the confused dispersion of which among the works of different writers caused much obscurity and contradiction.

This compilation, bearing the title *Glossa ordinaria* or *magistralis*, but usually known as the Great Gloss, though written in barbarous Latin, has more method than that of any preceding writer on the subject. The best edition of it is that of Denis Godefroi (1549–1621), published at Lyons in 1589, in 6 vol. folio. When Accursius was employed in this work, it is said that, hearing of a similar one proposed and begun by Odofred, another lawyer of Bologna, he feigned indisposition, interrupted his public lectures and shut himself up, till with the utmost expedition he had accomplished his design.

Accursius was greatly extolled by the lawyers of his own and the immediately succeeding age, and he was even called the idol of jurisconsults, but those of later times formed a much lower estimate of his merits. There can be no doubt that he disentangled the sense of many laws with much skill, but it is equally undeniable that his ignorance of history and antiquities often led him into absurdities, and was the cause of many defects in his explanations and commentaries. He died at Bologna in 1260. His eldest son Franciscus (1225–93), who also filled the chair of law at Bologna, was invited to Oxford by King Edward I, and in 1275 or 1276 read lectures on law in the university.

**ACCUSATION,** a legal term signifying the charging of another with wrong-doing, criminal or otherwise. For the accusation of another of a crime or of misconduct for the purpose of extortion, *see* BLACKMAIL.



**ACCUSATIVE,** a case of the noun, denoting primarily the object of verbal action or the destination of motion.

**ACE,** the number one at dice, or the single point on a die or card; also a point in the score of racquets, lawn tennis, tennis and other court games. From its conventional use as the highest in a suit in card games, the word came to be used during World War I to signify an aeroplane pilot of supreme skill and daring.

**ACELDAMA** (AKELDAMA, R. V.), land (originally a potter's field) said in Matthew to have been bought by the priests for a burial ground for strangers with the money which was returned by Judas and could not be put into the treasury "because it was the price of blood." Aramaic חקל דמא, "the field of blood," Acts i, 19; *cf.* Matt. xxvii, 8. Acts ascribes its purchase to Judas himself, perhaps by mere compression. Manuscript authority gives AKELDAMACH (Ἀκελδαμάχ, Westcott and Hort) "the field of thy blood," which is unsuitable. Klostermann's suggestion, *Probleme im Apostletexte* (1883, pp. 1–8), "the field of sleep" (*dmak*, "he

slept," used especially of sleep in death, *e.g.*, Targum of Job, iii, 12, Syr.: *dmaka*, "sleep") is very attractive, suggesting "cemetery," and although there is no other example of such a Jewish title the figure is old (Dan xii, 2). If so, Akeldama will be only the popular, perhaps Christian, nickname In any case Acts i, 19 can hardly be as early as St. Peter's speech in which it is incorporated. No plausible explanation is given for "ch" being added to Akeldama, and there is only one exactly parallel case, the mysterious *Sirach* for *Sira* (Ecclus. L, 27 [29]) Tradition from the 4th century places the plot on the Hill of Evil Counsel—"a little level plot overhanging the valley of Hinnom." . . . The potters probably "had here a cave in which their work was carried on." (*See* Schick, P E F Q. 1892, pp 283–289.) (A L. W)

**ACENAPHTHENE**, an aromatic hydrocarbon first isolated from coal tar by M. P. E. Berthelot and subsequently synthesized from α-ethylnaphthalene. Crystallizing from alcohol in colourless needles, it melts at 95° C. and boils at 278°. Its formula is $C_{12}H_{10}$. On oxidation with chromic acid it yields (1) acenaphthenequinone employed in the manufacture of ciba scarlet and other red vat dyes; (2) naphthalic acid, a starting point in the production of certain perylene vat dyes (*See* Dyes, Synthetic)

Acenaphthene, which readily undergoes nitration and sulphonation, forms a characteristic orange picrate melting at 161°.

*See* A E Everest, *The Higher Hydrocarbons* (1927).

(G T. M)

**ACEPHALI** (ἀκέφαλοι) a term applied to sects having no head or leader; and in particular to a strict Monophysite sect that separated itself, in the end of the 5th century, from the rule of the patriarch of Alexandria (Peter Mongus) and remained "without king or bishop" till it was reconciled by Mark I (799–819) (Gr. ἀ privative, and κεφαλή, head).

The term was also used to denote *clerici vagrantes; i.e.*, clergy without title or benefice (*cf.* Hinschius, i, p. 64).

Certain persons during the reign of King Henry I were called *Acephali* because they had no lands by virtue of which they could acknowledge a superior lord. The name was also given to certain legendary races described by ancient naturalists and geographers as having no heads, their mouths and eyes being in their breasts, generally identified with Pliny's Blemmyae.

*See* Gibbon, ch. xlvii (vol v, p. 129 in Bury's ed.).

**ACERACEAE**, a natural family of dicotyledonous plants allied to the Sapindaceae, consisting of 2 genera and about 125 species, all but 2 belonging in the genus *Acer*. This genus consists of trees always with opposite and mostly simple and usually lobed or toothed, rarely entire leaves, the characteristic fruits consisting of paired, winged, one-sided carpels, a typical samara. The genus *Acer* is mostly confined to the north temperate zone and is highly developed in species in North America and in temperate and subtemperate Asia. For a monographic treatment, *see* F Pax, *Aceraceae*, Pflanzenreich 8 (iv, 163), 1–89, fig. 1–14 (1902). *See* Maple. (E. D. Ml.)

**ACERENZA** (anc. *Acheruntia*), town in province of Potenza, Italy, the seat of an archbishop, 15½ mi. N.E. of the station of Pietragalla, which is 9 mi. N.W. of Potenza by rail, 2,730 ft. above sea level. Pop. (1936) 4,625 (town), 4,788 (commune).

**ACERRA**, town and episcopal see, province of Naples, Italy, 9 mi N E. from Naples. Pop. (1936) 19,177 (town), 21,937 (commune). The town lies on the right bank of the river Agno, 90 ft. above sea level, in a fertile but somewhat marshy district which in the middle ages was very malarious. The ancient name (*Acerrae*) was also borne by a town in Umbria and another in Gallia Transpadana (the latter modern Pizzighettone on the Adda, 13 mi. W.N.W. of Cremona). It became a city with Latin rights in 332 B.C., and later a *municipium*. It was destroyed by Hannibal in 216 B.C., but restored in 210; in 90 B.C. it served as the Roman headquarters in the Social War, and was successfully held against the insurgents. It received a colony under Augustus, but appears to have suffered much from floods of the river Clanis Under the empire no more is heard of it, and no traces of antiquity, beyond inscriptions, remain

**ACERRA**, in Roman antiquity, a small box or pot for holding incense, as distinct from the turibulum (thurible) or censer in which incense was burned The name was also given by the Romans to a little altar placed near the dead, on which incense was offered every day till the burial. In ecclesiastical Latin the term acerra is still applied to the incense boats used in the Roman ritual

**ACETABULUM**, the Latin word for a vinegar cup, an ancient Roman vessel, used as a liquid measure (equal to about half a gill), it also became used technically in zoology, by analogy for certain cup-shaped parts; *e g*, the suckers of a mollusc, the socket of the thighbone, etc.; and in botany for the receptacle of fungi

**ACETALDEHYDE** or simply aldehyde, is the second aldehyde (*q v.*) of the aliphatic series. Its molecular formula is $C_2H_4O$, and its structure is $CH_3$-CHO. It is a colourless liquid boiling at 21° C., and possessing a powerful characteristic odour. It occurs in the crude ethyl alcohol (*q v.*) obtained by the fermentation of sugars and in the crude methyl alcohol obtained by the destructive distillation of wood It is manufactured both by the oxidation of ethyl alcohol and by the hydration of acetylene (*q v.*) It is transformed by reduction into ethyl alcohol and by oxidation into acetic acid (*q.v.*).

**ACETAMIDE:** *see* Amides.

**ACETANILID**, also called antifebrin, made by interaction of glacial acetic acid with aniline (*q v.*). It is a febrifuge or antipyretic, used in headaches and fevers, of which it reduces the pain without removing cause. It may cause aniline poisoning, a depressant action on the heart muscle, resulting in collapse, nausea, vomiting and a blueness of lips and nails. The last is caused by chemical changes in the blood, whereby red corpuscles lose their power to carry oxygen.

Acetanilid is a white, crystalline substance melting at 115° C, boiling at 305° C and soluble in water, alcohol or ether. Its chemical formula is $C_6H_5.NH.CO.CH_3$.

**ACETATES:** *see* Acetic Acid.

**ACETIC ACID**, the organic acid which gives to vinegar (from which it derives its name) its characteristic sharp taste, is the second of the series of aliphatic acids, formic acid (*q.v.*) being the first.

Its formula is $CH_3\,CO_2H$, and it occurs in nature in plant juices occasionally as free acid but more generally as calcium or potassium salts.

Three processes are available for large-scale production of acetic acid, $CH_3.COOH$.

**1. Fermentation Processes.**—Several species of bacterium convert dilute alcoholic liquors into impure acetic acid in the form ordinarily known as vinegar. This bacterial fermentation, which takes place in the presence of air and a certain amount of nutrient phosphates and nitrogenous material necessary for the feeding of the bacteria, involves the oxidation of ethyl alcohol (*see* Alcohol) into dilute acetic acid. A more concentrated acid is obtainable by neutralizing the dilute acid with lime to form calcium acetate and then distilling a mixture of this salt with concentrated sulphuric acid.

Except for the manufacture of vinegar, the fermentation process is no longer an important factor in the industrial preparation of acetic acid.

In the oxidation of alcohol to acetic acid the living acetic bacteria may be replaced by specific enzymes (unorganized ferments) or even by spongy platinum or palladium since either of these, in the presence of air, oxidizes the alcohol first to acetaldehyde and then to acetic acid.

**2. Destructive Distillation of Wood.**—A relatively small proportion of the acetic acid of commerce is now obtained by the destructive distillation of wood, the hard woods yielding 4.7% to 6.5% of the concentrated acid.

**3. Synthetic Acetic Acid.**—The starting point in the industrial synthesis of acetic acid is calcium carbide made in the electric

furnace from limestone and coal. The acetylene evolved from the carbide by addition of water is converted into acetaldehyde by passing into hot dilute sulphuric acid containing mercuric sulphate. The acetaldehyde is further oxidized by air or oxygen in the presence of a catalyst consisting of the oxides of metals such as iron, vanadium and uranium, acetic acid being thereby formed.

In 1950 about 220,000 tons of synthetic acetic acid were made in the United States.

Anhydrous acetic acid, usually termed glacial acetic acid owing to its icelike crystallization at 16.7° C., has a very pungent odour and boils at 118° C. to a heavy inflammable vapour. Its alkali salts are soluble in water. Ferrous and ferric acetate are used as mordants in dyeing (*q.v.*). Normal lead acetate is known in commerce as sugar of lead and basic copper acetates are known as verdigris (*q.v.*).

Acetic acid and the acetates are detected by heating with ethyl alcohol and sulphuric acid; ethyl acetate is evolved and recognized by its fragrant odour. When heated with arsenious oxide, acetates give rise to the malodorous and highly poisonous cacodyl oxide.

**Pharmacology and Therapeutics.**—Glacial acetic acid is sometimes used as a caustic for corns The soluble acetates, and especially potassium acetate, are used mainly as alkaline diuretics and to counteract acidosis. After absorption in the blood, they are oxidized to carbonates, increasing the alkalinity of the blood or reducing the acidity of the urine without the disturbing influence of alkalis on the digestive tract.

**ACETOACETIC ESTER,** ethyl acetoacetate is an outstanding example of a chemical substance having a dual character arising from the possession of two different molecular structures. Such substances are called tautomeric compounds (*see* ISOMERISM). The substance is an ester (which see), and has the molecular formula $C_6H_{10}O_3$. The two tautomeric forms are represented by

$$CH_3.CO.CH_2.CO.OC_2H_5 \text{ (ketonic form) and}$$
$$CH_3C(OH):CH.CO_2C_2H_5 \text{ (enolic form),}$$

and ordinary specimens of the ester as handled in commerce may be regarded as consisting of 93% of the former in equilibrium with 7% of the latter. When treated by reagents which combine with ketones, such as sodium bisulphite, hydroxylamine, phenylhydrazine and hydrocyanic acid, the ketonic character of the ester is manifested, and when acted upon by reagents such as phosphorus pentachloride, diazomethane, ammonia and amines, which detect alcoholic (enolic) groups, then its enolic nature is revealed.

In 1911 L. Knorr separated the two forms of the ester in a state of purity. The ketonic modification was frozen out of the equilibrium mixture at −78° C. and the enolic modification was isolated in the liquid condition by decomposing the sodium derivative with hydrogen chloride at the same low temperature. In these experiments it was found to be essential to use silica vessels. The ester was first discovered by A. Geuther in 1863. The original method of production is still employed on a manufacturing scale. Sodium, either molten or in wire form, is added to dry ethyl acetate containing a little ethyl alcohol. When all the metal has dissolved the mixture is acidified with dilute acetic or sulphuric acid and the crude acetoacetic ester, which is partially miscible with water, separates as an oil on addition of common salt and is purified by distillation under diminished pressure. The ester is a colourless, fragrant liquid boiling, with slight decomposition, at 181° C. under a pressure of 760 mm.

The sodium condensation requires the presence of a small amount of alcohol. The role of this alcohol is made apparent by the following probable mechanism of the reaction:

i. $2C_2H_5OH + 2Na = 2C_2H_5ONa + H_2$
ii. $CH_3CO_2C_2H_5 + C_2H_5ONa = CH_2:C(ONa)OC_2H_5 + C_2H_5OH$
iii. $CH_2:C(ONa)OC_2H_5 + CH_3CO_2C_2H_5 =$
$CH_3C(ONa):CH.CO_2C_2H_5 + C_2H_5OH$

In the chemical laboratory acetoacetic ester is a valuable synthetic reagent, for its sodium derivative when acted on by an alkyl iodide yields an alkylacetoacetic ester, and the sodium derivative of the latter ester by similar means furnishes a dialkylacetoacetic ester. These alkyl- and dialkyl-acetoacetic esters may be employed in producing either higher ketones or higher fatty acids.

The ester has also been employed in the synthesis of pyridines (*q.v.*), quinolines (*q.v.*), furans (*q.v.*), pyrazoles (*q.v.*), pyrroles (*q.v.*), and compounds of the purine (*q.v.*) group.

In addition to the foregoing scientific uses acetoacetic ester is utilized industrially in the manufacture of synthetic drugs and dyes. Of these drugs the best known is antipyrine (*q.v.*) which is prepared by methylating phenylmethylpyrazolone, the condensation product of acetoacetic ester and phenylhydrazine.

Several important dyes belong to the pyrazolone series. Eriochrome red (Chrome fast red B) is manufactured by successively condensing acetoacetic ester with phenylhydrazine and with diazotized 1-amino-β-naphthol-4-sulphonic acid. A series of yellow dyes and pigment colours is similarly produced by condensing the ester successively with various aromatic hydrazines and diazo-compounds (*see* DYES, SYNTHETIC).

**ACETONE** is present in very small quantities in normal urine, in the blood, and in larger quantities in diabetic patients, and is the simplest representative of the aliphatic ketones. It results with other ketones from the destructive distillation of wood and other cellulosic derivatives, and for this reason it is present in crude wood spirit (methyl alcohol). It has the formula $CH_3\,CO\,CH_3$ and is thus dimethyl ketone. Acetone is a colourless, fragrant, inflammable, mobile liquid, boiling at 56.3° C. and miscible in all proportions with water, alcohol and ether. It has very useful solvent properties, dissolving considerable quantities of acetylene gas (*q.v.*). It dissolves many fats and resins and is a solvent for cellulose nitrate and acetate. On account of the latter properties, it finds extensive use in the manufacture of cordite and of artificial silk.

On account of its valuable properties as a solvent and as an organic reagent, acetone is prepared on a large scale, the processes available being as follows:—

1. The dry distillation of calcium acetate leading to the formation of acetone and calcium carbonate.
2. The catalytic (*see* CATALYSIS) decomposition of glacial acetic acid into acetone, carbon dioxide, and water when it is passed over heated metallic oxides such as alumina and thoria.
3. The fermentation of maize, rice, horse chestnut meal or other starchy materials with a bacterium discovered by A. Fernbach, the starch present being converted into a mixture of normal butyl alcohol (6 parts), acetone (3 parts) and ethyl alcohol (1 part).
4. The dehydrogenation or oxidation by air of isopropyl alcohol in the presence of heated metallic or metal oxide catalysts.

Acetone is employed in many organic syntheses. Dehydrating agents convert it successively into mesityl oxide and phorone, and on distillation with sulphuric acid it is transformed by elimination of water into mesitylene (1:3:5-trimethylbenzene). In conjunction with *ortho*nitrobenzaldehyde, it has been used to prepare synthetic indigo.

*Therapeutic Applications.*—The ketones in general give rise to narcosis and lowering of blood pressure and acetone itself produces intoxication and sleep but is less powerful than ether or chloroform, although less toxic than ethyl alcohol. When treated with chlorine, bromine, or iodine in presence of alkali, acetone is converted respectively into chloroform, bromoform, or iodoform. It is the starting point in the production of the narcotic drug sulphonal.

BIBLIOGRAPHY.—Lloyd C. Cooley, *Ind. Eng. Chem.* (1937); Carleton Ellis, *The Chemistry of Petroleum Derivatives* (1934–37).

**ACETOPHENONE** or phenyl methyl ketone is the simplest representative of the mixed aliphatic-aromatic ketones. It crystallizes in colourless leaflets with a characteristic odour; it melts at 20° C. and boils at 202° C., is volatile in steam and has the composition, $C_6H_5.CO.CH_3$. It occurs to a small extent in coal tar and, having feebly basic properties, is extracted from the heavy oil fractions (b.p. 160–190°) with sulphuric acid.
